History Of Vaccination

“Without data, you’re just another person with an opinion.” —W. Edwards Deming, engineer, data scientist

Each book in the History of Vaccination series is accompanied by the same prologue. If you’ve already read the prologue, feel free to skip to the book original book. The 25 historical works I’ve restored and updated shed light on the nature of vaccination, as recorded by the most distinguished doctors and scientists of their time. Their statements are backed by historical statistics, which are presented throughout these books.

The first smallpox vaccine was conceptualized in 1796. Since that time, vaccination has been rife with controversy. Let’s review what writers, doctors, and scientists have observed about vaccines across three centuries—19th, 20th, and 21st.

19TH CENTURY (1800s)

“There does not exist one single fact, in all the experiments and improvements made in science, which can support the idea of vaccination. A vaccinated people will always be a sickly people, short lived and degenerate.” —Dr. Alexander Wilder, MD, “Vaccination: A Medical Fallacy”, editor of the New York Medical Tribune, 1879

“I have seen leprosy and syphilis communicated by vaccination. Leprosy is becoming very common in Trinidad; its increase being coincident with vaccination.” —Dr. Hall Bakewell, Vaccinator General of Trinidad, 1868

“Cancer is reported to be increasing not only in England and the Continent, but in all parts of the world where vaccination is practised.” —Dr. William S. Tebb, MA, MD, DPH, “The Increase of Cancer”, 1892

“Leprosy arose with vaccination.” —Sir Ronald Martin, MD, 1868

"Syphilis has undoubtedly been transmitted by vaccination." —Sir William Osler Bt., MD, FRS, FRCP
“To no medium of transmission is the widespread dissemination of this class of disease (syphilis) so largely indebted as to Vaccination.” —Dr. B.F. Cornell, MD, 1868

“Every intelligent person who takes the time to investigate vaccination, will find abundant evidence in the published writings and public records of the advocates of vaccination, to prove its utter worthlessness, without reading a line of anti-vaccination literature. And if we could add to this all the suppressed facts, we would have a mass of evidence before which no vaccinator would dare to hold up his head.” —Dr. Robert A. Gunn, MD, “Vaccination: Its Fallacies and Evils”, 1882

“I have no faith in vaccination, nay, I look upon it with greatest disgust, and firmly believe that it is often the medium of conveying many filthy and loathsome diseases from one child to another, and it is no protection from smallpox.” —Dr. William Collins, MD, London, 1882

“Vaccination has made murder legal. Vaccination does not protect against smallpox, but is followed by blindness and scrofula. Jennerism is the most colossal humbug which the human race has been burdened with by FRAUD and DECEIT.” —Mr. Mitchell, member of the British House of Commons

“Of these dogmas, I believe the practice known as vaccination to be the most absurd and most pernicious. I do not believe that a single person has ever been protected from smallpox by it; while I know that many serious bodily evils and even deaths, have resulted from its employment. The whole theory is founded upon assumption, contrary to common sense and entirely opposed to all known principles of physiology. Every physician of experience, has met with numerous cases of cutaneous eruptions, erysipelas and syphilis, which were directly traceable to vaccination, and if these cases could be collected and presented in one report, they would form a more terrible picture than the worst that has ever been drawn of the horrors of smallpox.” —Dr. Robert A. Gunn, MD, Dean of the United States Medical College of New York

"Vaccination is a monstrosity, a misbegotten offspring of error and ignorance; and, being such, it should have no place in either hygiene or medicine...Believe not in vaccination, it is a worldwide delusion, an unscientific practice, a fatal superstition with consequences measured today by tears and sorrow without
end.” —Dr. Carlo Ruta, Professor of Materia Medica at the University of Perugia, Italy, 1896

“Vaccination is a grotesque superstition.” —Dr. Charles Creighton, MD, MA

“Vaccination is a gigantic delusion. It has never saved a single life. It has been the cause of so much disease, so many deaths, such a vast amount of utterly needless and altogether undeserved suffering, that it will be classed by the coming generation among the greatest errors of an ignorant and prejudiced age, and its penal enforcement the foulest blot.” — Alfred R. Wallace, LLD DUBL., DCL OXON., FRS, etc., 1898

20TH CENTURY (1900s)

“The great epidemics of deadly diseases, in animals and mankind, are caused by vaccination.” —Charles M. Higgins, “The Horrors of Vaccination: Exposed and Illustrated”, 1920

“I believe vaccination has been the greatest delusion that has ensnared mankind in the last three centuries. It originated in FRAUD, ignorance and error. It is unscientific and impracticable. It has been promotive of very great evil, and I cannot accredit it any good." —Dr. R. K. Noyse, MD, Resident Surgeon of the Boston City Hospital, “Self Curability of Disease”

“The chief, if not the sole, cause of the monstrous increase in cancer has been vaccination.” —Dr. Robert Bell; Vice President, International Society for Cancer Research, British Cancer Hospital, 1922

“Vaccination is the most outrageous insult that can be offered to any pure-minded man or woman. It is the boldest and most impious attempt to mar the works of God that has been attempted for ages. The stupid blunder of doctor-craft has wrought all the evil that it ought, and it is time that free American citizens arise in their might and blot out the whole blood poisoning business.” —Dr. J.M. Peebles, MD, MA, PhD, “Vaccination: A Curse and Menace to Personal Liberty”, 1900

“Cancer was practically unknown until the cowpox vaccination began to be introduced. I have seen 200 cases of cancer, and never saw a case in an
unvaccinated person.” —Dr. W.B. Clark, MD, Indiana, New York Times article, 1909

“At present, intelligent people do not have their children vaccinated, nor does the law now compel them to. The result is not, as the Jennerians prophesied, the extermination of the human race by smallpox; on the contrary more people are now killed by vaccination than by smallpox.” —George Bernard Shaw, 1944

“The English Ministry of Health omits to state that in 1872, when 85% of the infants born were vaccinated, there were 19,000 deaths from smallpox in England and Wales. While in 1925, when less than half the children born were vaccinated, there were only 6 deaths from that disease.” —Dr. Eleanor McBean, PhD, ND, “The Poisoned Needle”, 1957

“Vaccination causes miscarriage. A careful check showed that 47% of women who had been vaccinated in the second or third month of pregnancy, failed to give birth to a normal child.” —“Vaccination at Work”, The Consulting Pediatrician of Lanarkshire County Council, The Lancet (London), p.47, December 6, 1952

"My honest opinion is that vaccine is the cause of more disease and suffering than anything I could name." —Dr. Harry R. Bybee

“Vaccination, instead of being the promised blessing to the world, has proved to be a curse of such sweeping devastation that it has caused more death and disease than war, pestilence, and plague combined. There is no scourge (with the possible exception of atomic radiation) that is more destructive to our nation’s health than this monument of human deception—this slayer of the innocent—thiscrippler of body and brain—the poisoned needle.” —Dr. Eleanor McBean, PhD, ND, “The Poisoned Needle”, 1957

“The greatest LIE ever told is that vaccines are safe and effective.”—Dr. Leonard Horowitz, MPH (Master of Public Health), DMD, MA, Harvard University graduate

21ST CENTURY (2000s)
“The entire vaccine program is based on massive FRAUD.”—Dr. Russell L.
Blaylock, M.D., neurosurgeon, editorial staff of Journal of American Physicians and Surgeons

"Vaccinations do not work. They don’t work at all.” —Dr. Lorraine Day, MD

“Vaccinations are now carried out for purely commercial reasons because they fetch huge profits for the pharmaceutical industry. There is no scientific evidence that vaccinations are of any benefit.” —Dr. Gerhard Buchwald, MD, “Vaccination: A business based on FEAR”

“Don’t get your flu shot.” —Dr. Raymond Francis, D.Sc., M.Sc., RNC, chemist, MIT graduate

“My own personal view is that vaccines are unsafe and WORTHLESS. I will not allow myself to be vaccinated again. Vaccines may be profitable but in my view, they are neither safe nor effective.” –Dr. Vernon Coleman, MB, ChB, DSc (Hon)

"Everyone who is vaccinated is vaccine injured—whether it shows up right away or later in life." —Dr. Shiv Chopra, B.V.S., A.H., M.Sc., PhD, Fellow of the World Health Organization, former senior scientist at Health Canada

“The pediatrician indoctrinates your child from birth into a lifelong dependency on medical intervention. The first stage of indoctrination is the ‘well-baby’ visit. The well-baby visit is a cherished ritual of the pediatrician that enhances their income and does nothing constructive for your child. It’s a worthless visit.” —Dr. Robert Mendelsohn, MD, board certified pediatrician

“Vaccines are the backbone of the entire Pharmaceutical Industry. If they can make these children sick from a very early age, they become customers for life. The money isn’t really to be made in the vaccine industry. The money is made by Big Pharma with all of the drugs that are given to treat and address all of the illnesses that are subsequent to the side effects of vaccines.”—Dr. Sherri Tenpenny, D.O. (osteopathic medical doctor)

“Studies are increasingly pointing to the conclusion that vaccines represent a dangerous assault to the immune system leading to autoimmune diseases like Multiple Sclerosis, Lupus, Juvenile Onset Diabetes, Fibromyalgia, and Cystic Fibrosis, as well as previously rare disorders like brain cancer, SIDS (Sudden Infant Death Syndrome), childhood leukemia, autism, and asthma.”—Dr. Zoltan
Rona, MD, “Natural Alternatives to Vaccination”

“The vaccine industry is itself a FRAUD. I spent my whole career studying vaccines.”—Dr. Shiv Chopra, B.V.S., A.H., M.Sc., Ph.D., Fellow of the World Health Organization, “Corrupt to the Core”

THE ONLY REASON FOR CONTINUED VACCINATION

“The greatest danger to your health is the doctor who practices modern medicine.” —Dr. Robert Mendelsohn, MD, board certified pediatrician

Follow the money. It will lead you to the truth. The primary reason for vaccination is the assumption that vaccines prevent diseases. However, if historical data demonstrates that vaccines do NOT prevent diseases, then what is the purpose of vaccination?

Moreover, you’ve probably heard stories of parents being coerced and bullied into vaccinating their children and themselves at the pediatrician and doctor’s offices. There are reasons behind the coercion and bullying.

“There is a vaccination ring in England, receiving millions of the public money. It is in their interest to favor the practice at all hazards and to falsify statistics in order to conceal its failure and its evils. There are also armies of public vaccinators in every large city all over Europe, who are supported from the public treasury, and every practitioner who does not oppose the practice, derives a considerable income from its continuance.” —Dr. Robert A. Gunn, MD, “Vaccination: Its Fallacies and Evils”, 19th century

“Drug companies are not here to bring health to the population but to SCAM them on one level for vast amounts of money.” —Sir William Osler, MD, FRS, FRCP, widely considered as the Father of Modern Medicine (1849-1919), 20th century

“Disease is more rampant because of commercial greed. When the Rockefeller-Standard Oil crowd muscled into the drug and pharmaceutical business in such a big way, ‘scientific medicine’ (if there is such a thing) was turned into a racket
which shortened many American lives from ten to twenty years.” —Morris A. Beale, “The Drug Story”, 20th century

“Many doctors and some editors are making money by propagating the vaccination curse.” —Dr. Thomas Morgan, MD, “Medical Delusions”, 20th century

“Vaccination is not scientific. Many of the world’s greatest thinkers, scientists, statesmen and even doctors have condemned vaccination as being a crime against humanity, a FRAUD promoted for private gain, an insult to the race and a blot upon the name of civilization. Yet, this treacherous practice of blood pollution, which was cradled in the lap of ignorant savage tribes, has been adopted by, supposedly, enlightened government of the present day and forced on the protesting population—for profit.” —Dr. Eleanor McBean, PhD, ND, 1957

“Vaccinations are now carried out for purely commercial reasons because they fetch huge profits for the pharmaceutical industry. There is no scientific evidence that vaccinations are of any benefit.” —Dr. Gerhard Buchwald, MD, "Vaccination: A Business Based on Fear", 21st century

“The vaccination myth is the most widespread superstition modern medicine has managed to impose, but, being by the same token the most profitable, it will prove to be also one of the most enduring, though there was never the slightest of scientific evidence upholding it.” —Hans Ruesch, "The Great Medical Fraud", 20th century

“Doctors are punished by insurance companies like Blue Cross and Blue Shield if doctors don’t get a certain percentage of their patients to comply with the vaccination schedule. If 63% are non-compliant, they don’t receive any of their bonuses.” —Robert F. Kennedy, Jr.

“Medicine is no longer a calling. It is a downright cut throat business.” —Professor Dr. Belle Monappa Hegde, MD, 21st century

"The current medical system is designed to create chronic disease. There is no money in being healthy.” —Dr. Irvin Sahni, MD, 21st century

“The bottom line is that the medical systems are controlled by financiers in order
to serve financiers. Since you cannot serve people unless they get sick, the whole medical system is designed to make people sicker and sicker.” —Dr. Guylaine Lanctot, MD, 21st century

"It is difficult to get a person to understand something, when their salary depends on them not understanding it." —Upton Sinclair, “The Jungle”

In 1986, US President Ronald Reagan passed the National Childhood Vaccine Injury Act (NCVIA). The act was drafted by the drug companies and shielded them from legal liability resulting from vaccine injuries and deaths. Basically, NCVIA prevented parents from directly suing the drug companies (vaccine makers). The parents have to file claims in the vaccine injury court that was established through the act. About $0.75 of every vaccine sold is used to fund the vaccine injury court. From 1986 to 2018, the court paid over $4 billion to parents with vaccine injured children. It is estimated that the court, due to budget constraints, dismisses about 66% of the cases, and some cases can take up to 8 years to settle.

Furthermore, in one report US and Human Services estimated that only about 1% of vaccine injuries are reported to VAERS (Vaccine Adverse Event Reporting System). Most parents are unaware that the most common side effects of vaccines are allergies, asthma, brain damage, autoimmune diseases, cancer, and death. In addition, from 1986 to 2017, the drug companies were fined nearly $25 billion—these fines were unrelated to vaccines and most were for fraud, bribery, and false advertising.

"International bribery and corruption, fraud in the testing of drugs, criminal negligence in the unsafe manufacture of drugs—the pharmaceutical industry has a worse record of lawbreaking than any other industry. Data fabrication is so widespread that it is called 'making' in the Japanese pharmaceutical industry, 'graphiting' or 'dry labelling' in the United States." —Dr. John Braithwaite, MD, "Corporate Crime in the Pharmaceutical Industry"

Knowing how they operate, could you trust your child’s health to the drug companies?

**Never Vaccinate Your Child**
Lessons from Parents, Doctors, Scientists, Media, and HISTORY
Trung Nguyen
June 2018
Prologue

“Vaccination is a business based on fear.” —Dr. Gerhard Buchwald, MD

You’ve probably heard comedians, actors playing doctors and scientists, news anchors, and strangers online publicly proclaim,

–Vaccines are safe and effective.
–Vaccines prevented diseases and saved millions of lives
–Vaccines work. They’re a blessing and miracle to the human race.

Even your doctor or pediatrician might had proclaimed in private that “vaccines are safe and effective.” What some physicians state in private about vaccines, they’ll never do in public for fear of being sued for malpractice. This demonstrates that people can be brainwashed in three sentences, repeated over and over and over again by different groups, through different modes of media.

“A lie told often enough becomes the truth.” —Vladimir Lenin

Anyone who thinks vaccines are safe and effective has never read a book presenting the other side of vaccination. They believe vaccines are safe and effective through the carefully orchestrated advertising and marketing campaigns of the drug companies, who make tens of billions from vaccines each year.

If you’re busy, and don’t require a lecture on the history of vaccination, you only need to inspect the graphs and tables below. These tables and graphs, compiled from historical data, demonstrate that there is no reason for anyone to get vaccinated.

“Three things cannot be long hidden: the sun, the moon, and the truth.” —Buddha

BEFORE VACCINATION

People’s chances of dying from certain infectious diseases before vaccines were introduced were extremely rare. So rare that if it weren’t for the drug industry’s disease mongering, we wouldn’t be discussing this subject.
Before vaccination. As you can see, the chances of anyone being harmed by these “vaccine preventable diseases” are so small that it’s not even worth worrying about. In many cases, you have a higher chance of being struck by lightning or a meteorite than harmed by these “life threatening diseases”. Source: 1) CDC Reported Deaths from Vaccine Preventable Diseases, US, 1950-2011, 2) Vital Statistics in the United States 1940-1960, US Department of Health, Education, and Welfare.

**VACCINES DID NOT ERADICATE DISEASES**

The graphs below show the decline of infectious diseases in the US and England BEFORE vaccines were introduced. As evident as night and day, most diseases were nearly eradicated, then the drug companies introduced vaccines and took credit, when vaccines had no role in eradicating those diseases.
Before vaccines were introduced in the US. In the US, every “vaccine preventable disease” was nearly eradicated, then several years later the drug companies introduced vaccines and gave credit to them for what sanitation, hygiene, and nutrition achieved. Source: 1) Vital Statistics in the United States, 1940-1960, US Department of Health, Education, and Welfare, 2) Historical Statistics of the United States—Colonial Times to 1970, Part 1.
Before vaccines were introduced in England and Wales. Similar to the US, every “vaccine preventable disease” was on a sharp decline before vaccines were introduced for those diseases. Source: Record of Mortality in England and Wales for 95 years as provided by the Office of National Statistics, published 1997; Report to the Honourable Sir George Cornewall Lewis, Bart, MP Her Majesty’s Principal Secretary of State for the Home Department, June 30, 1860, p. a4, 205; Essay on Vaccination by Dr. Charles T. Pearce, MD, Member of the Royal College of Surgeons of England, Parliamentary Papers, the 62nd Annual Return of the Registrar General 1899 (1891-1898).
Figure 14.—Death Rates for Tuberculosis, All Forms: Death-registration States, 1900–32, and United States, 1933–60

(Rates per 100,000 population)
Death rates for tuberculosis in the US, 1900-1960. The Calmette-Guérin (BCG) tuberculosis vaccine was first used in 1921 in some countries. However, it was not used in the US until the late 1940s, and only used on a small scale. In the US, from 1900-1940, tuberculosis had declined dramatically without vaccination. Graph: Vital Statistics in the United States, 1940-1960, US Department of Health, Education, and Welfare
Figure 19.—Death Rates for Measles: Death-registration States, 1900–32, and United States, 1933–60
(Rates per 100,000 population)
Measles in the US, 1900-1960. Measles was mostly harmless and the death rate was extremely low in 1960, lower than being struck by lightning. In 1963, the drug companies introduced the measles vaccine and took credit for eradicating measles. It’s been shown that measles is beneficial to the immune system, particularly in fighting cancer later in life. Prior to 1963, measles was considered a benign illness (not a disease); parents would encourage their children to visit friends who had measles so their children could contract measles and get it over with. Measles, due to the drug industry’s disease mongering, is now a life threatening disease. Graph: Vital Statistics in the United States, 1940-1960, US Department of Health, Education, and Welfare

It wasn’t vaccination that saved humanity. The things that saved humanity were,

– clean-running water (sewer systems, indoor plumbing, toilets, sinks, showers)
– sanitation (garbage collection, modern building codes),
– hygiene (soap, paper towels),
– electricity (indoor heating, refrigeration),
– and nutrition (supermarkets) that saved humanity.

DISEASES that were eradicated by nutrition: scurvy, rickets, beriberi, goitre, hypoanatremia, anemia, kwashiorkor, marasmus, etc.

DISEASES that were eradicated without vaccines: scarlet fever, rheumatic fever, typhus, cholera, tuberculosis.

DISEASES that vaccines took credit for eradicating: smallpox, diphtheria, pertussis (whooping cough), polio, measles. As the data clearly shows, these diseases were never eradicated by vaccines.

NEW DISEASES that were unheard of by the public decades ago: cervical cancer, zika, ebola, swine flu, avian flu, bovine flu. Diseases, like wars, are manufactured for profit. For example, the Zika virus (small head birth syndrome) was caused by insecticides introduced into Brazil’s water system to kill mosquitos. This was widely reported by the Brazilian media and common knowledge in Brazil. However, according to the US media, Zika was caused by a virus of speculative origin. Nevertheless, the US drug companies were more than happy to provide the Zika vaccine to people around the world.

There are over 200 infectious diseases capable of causing death. However, only
the diseases with vaccines are presented to the public as life threatening and a public health risk. Moreover, in 2018, the drug companies use disease incident and mortality rates from developing and third world countries as part of their disease mongering campaigns. The more you study the history of vaccination, the more you’ll conclude that it is one of the biggest frauds in history. It’s certainly the biggest medical fraud in history—vaccines never saved a single life and never prevented a single disease.

**AFTER VACCINATION: VACCINATED vs. UNVACCINATED**

Let’s examine your chances of dying from certain infectious diseases AFTER vaccines were introduced.
After vaccines were introduced. Data gathered and tabulated from the CDC (Centers for Disease Control and Prevention), and VAERS (Vaccine Adverse Event Reporting System), 2014. When you vaccinate, you are 6.25x (625%) more likely to die from the toxins in the vaccines than the diseases those vaccines are supposed to prevent. Vaccination is all risk and no reward.

</table>

To put the tables and graphs into perspective: In the US, more people die from falling down the stairs (about 1 000 per year) than from “vaccine preventable diseases.” They are more than 100 000 times likely to die in an automobile accident. This was before the vaccines were introduced for those particular diseases (most of them are not even diseases but illnesses reclassified as
diseases). The deaths from these diseases are now caused by the vaccines themselves. For example, measles is a side effect of the measles vaccine. Polio is a side effect of the polio vaccine, and so forth. The side effects are the reason you are 625% more likely to die from the vaccines than the diseases they’re supposed to prevent.

“The further I looked into it, the more shocked I became. I found that the whole vaccine business was indeed a gigantic hoax. Most doctors are convinced that they are useful, but if you look at the proper statistics and study the instance of these diseases, you will realise that this is not so.” —Dr. Archie Kalokerinos, MD, PhD, AMM, MBBS, FAPM, pediatrician for over 30 years

It is through revising history, fabricating data, fear, and greed that the blood poisoning practice of vaccination continues into the 21st century.

Vaccination Is Based on Theories

“There is no evidence whatsoever of the ability of vaccines to prevent any disease.” —Dr. Viera Scheibner, PhD

In the words of the scientist Alfred R. Wallace, vaccines are “useless and dangerous.” If something is useless, it doesn’t work and has no benefit. If something is dangerous, it shouldn’t be used. Vaccines are useless because they never prevented a single disease. Not one. They are dangerous because they cause diseases and deaths—often the very diseases they are supposed to prevent. Through statistics across three centuries, the conclusion is resoundingly clear:

Vaccines only work in theory. In practice, they cause diseases and deaths.

In order for an idea to be universally accepted as a science, it must pass two stages:

1) Theory.
2) Observation.

Theoretical science and observational science are two sides of the same coin.

THE THEORETICAL SCIENCE OF VACCINES. The theory of vaccines is to
inject antigens (toxins) such as poisons, viruses, and diseases into the body. In turn, these antigens (toxins) should create antibodies (disease fighting proteins) to fight pathogens (diseases) in the future. In other words, the poisons, viruses, and diseases injected into the body are meant to trigger and train the immune system. Or to prepare the immune system cells to fight diseases in the future. In theory, this is possible because the immune system cells have memory. That is the theoretical science side of vaccines. At first glance, the vaccine theory has validity.

THE OBSERVATIONAL SCIENCE. Observation on the effectiveness of a product, as reported by the end consumers, is based on statistics and real world data, not what happened in laboratories and under microscopes. Observation has clearly shown that when you inject poisons, viruses, and diseases into the body, those antigens (toxins) cause diseases and deaths, especially among infants and children.

**Antigen:** A toxin or other foreign substance that induces an immune response in the body, especially the production of antibodies.

**Antibody:** A blood protein produced in response to and counteracting a specific antigen. Antibodies combine chemically with substances that the body recognizes as alien, such as bacteria, viruses, and foreign substances in the blood. (Source: Google Dictionary)
The antigen-antibody theory is similar the lock-and-key system. When antigens (something harmful to the body) is introduced into the body, it triggers the immune system to create antibodies to fight the antigens. The antibodies fit and bind with the antigens (toxins) like a lock and key.

The indirect end users of vaccines are parents, and millions of them have reported that their children have acquired diseases such as allergies, asthma, brain damage, autoimmune diseases, and cancer after being vaccinated. Thousands of parents have also reported that their children have died after vaccination. SIDS (Sudden Death Syndrome) is actually VIDS (Vaccine Induced Death Syndrome). Babies are not born to fall asleep and die in their sleep.

These diseases and deaths reported by parents are on the VAERS (Vaccine Adverse Event Reporting System) database. What is horrifying is that the diseases and deaths reported by parents are actually listed on the vaccine inserts provided by the drug manufacturers. These product inserts are usually 10 to 30 pages long, and not the one page printout the pharmacies and doctors provide when you ask.

Furthermore, every independent study (those not funded by the drug companies),
without exception, has shown that unvaccinated children are far healthier than vaccinated children. In addition, vaccinated people, through the *shedding* process, are disease carriers up to 60 days of being vaccinated. Thus, vaccinated people are a threat to themselves and others.

**INFANT VACCINATION.** It is known that infants and children succumb to more infectious diseases than other groups. The reason is that newborns only fully develop their immune system when they’re 3 to 5 years old. The antibodies infants require to ward off diseases are passed to them from the mother through the placenta. The amount and type of antibodies the infant receives from the mother depends on the health of the mother herself, and the antibodies in her own immune system. At roughly 6 months old, the infant is capable of producing its own antibodies. However, again, a child’s immune system is only fully developed when it is 3 to 5 years of age.

The theory of vaccination is to trigger and train the immune system. However, if the infant lacks a fully developed immune system until it’s 3 to 5 years old, then vaccination is useless. Yet, babies are being vaccinated immediately after birth. As of 2018, the US has the highest infant vaccination rate, and it also happens to have the highest infant mortality rate among developed countries.

"Vaccination at its core is neither a safe nor an effective method of disease prevention...If an infant needs one vaccine that is 100% safe and effective—that would be breast milk." —Dr. Tetyana Obukhanych, PhD, immunologist, Harvard graduate

If vaccines cause a long list of diseases, how is it possible that they can prevent disease? By virtue of their antigen-antibody theory, vaccines cannot prevent disease. They never have and never will. Nor can there be a “safe’ vaccine. It is only through clever advertising, marketing, and bribery that the drug companies have convinced the public that vaccines prevent diseases and save lives.

In 2017, the drug companies spent $200 million bribing politicians, $6.4 billion on advertising, and $10 billion indirectly bribing doctors. Since 1796, doctors and scientists have called vaccines useless, worthless, poisonous, dangerous; a fraud, racket, and scam. And for good reasons.

Medical students thoroughly study books on germ, bacteria, pathogen, microbe, and vaccination theories. Only to have their worldview shattered when they’re introduced to parents whose children have been injured and killed by vaccines. The lesson with vaccination science is that results observed in laboratories and under microscopes cannot be duplicated in the real world. The human body is indemonstrably complex due to individual biochemistry.

“In our scientific research we have now advanced one step. Vaccination is the infliction of disease…We conclude, then, that Vaccination is NOT scientific; that it cannot be accurately defined; that it is completely useless for its assumed purpose; that fortification of the body by disease is a mischievous myth, and that the sooner the practice is discontinued the better it will be for the health of the community.”  —George S. Gibbs, Fellow of the Statistical Society London, “Is Vaccination Scientific?”, 1884
The practice of vaccination is to inject poisons, viruses, and diseases into the body. Although vaccines come in oral and other forms, injection is the primary delivery method. Throughout history, millions have been diseased and killed by this “grotesque superstition.” More people have been killed by vaccines than the diseases they’re supposed to prevent.

Vaccines Cause Diseases
The first smallpox vaccine was conceptualized in 1796 by Edward Jenner (1749-1823) of England. Since that time, the ingredients (antigens, toxins) used in vaccines have changed dramatically. As the vaccine ingredients changed over the centuries, the diseases caused by vaccines have also changed. In other words, as you inject different poisons into the body, the body acquires different diseases.

VACCINE INGREDIENTS IN THE 1800s. From roughly 1800 to the early 1900s, the vaccine ingredients were primary from animal and human diseases. These diseases (vaccine ingredients) included animal and human pus, cowpox, ass-pus from rabbits, horsegrease, and sheep-pox.

Pox: Any of several viral diseases producing a rash of pimples that become pus-filled and leave pockmarks on healing.

Pus: A thick yellowish or greenish opaque liquid produced in infected tissue, consisting of dead white blood cells and bacteria with tissue debris and serum. (Source: Google Dictionary).
A pus on a hand.
Cowpox. From the early 1800s to the early 1900s, cowpox was the main vaccine ingredient in the smallpox vaccine. Cowpox, a cow disease, and smallpox, a human disease, had few physiological similarities. They were similar in that the words for both diseases ended with “pox”.
For centuries people believed that taking a disease from animals and inserting it into the human body prevented diseases. The vaccination theory was based on superstition.
Crude instruments. Human and animal diseases were inserted into the body by creating an incision in the body, usually the arm, with crude tools like the ones above.

When animal diseases such as pus and pox were used as vaccine ingredients, the diseases they caused were as many as they are now. The diseases caused by vaccines were recorded by J.T. Biggs, JP, sanitation engineer, in “Leicester: Vaccination versus Vaccination”, 1912, chap. 96:

“While not proposing to give a complete list, I append the principal of those vaccine-induced diseases which have already been published or come to my knowledge:
Furthermore,

"The most distinguished names in the profession have testified to vaccination being the certain vehicle for the dissemination of leprosy. These names include Sir Erasmus Wilson (sometimes called the father of dermatologists); Dr. John D. Hillis; Dr. Liveing; Sir Ranald Martin; Professor W. T. Gairdner; Dr. Tilbury Fox; Dr. Gavin Milroy; Dr. R. Hall Bakewell, formerly Physician to the Leper Asylum, Trinidad; Dr. A.S. Black, of Trinidad; Dr. Edward Arning; Dr. Walter M. Gibson, late President of the Honolulu Board of Health; Professor H. G. Piffard, New York; Dr. A. M. Brown, London; Dr. Frances Hoggan; Dr. Blanc,
Professor of Dermatology, University of New Orleans; Dr. Bechtinger, of Rio; Professor Montgomery, of California; Dr. Sidney Bourne Swift, late Medical Director, Leper Settlement, Molokai, Hawaii; Dr. P. Hellat, St. Petersburg; Professor Henri Leloir, Lille; Dr. Mouritz; Surgeon Brunt; Dr. John Freeland, Government Medical Officer, Antigua; Dr. S. P. Impey, Superintendent Leper Asylum, Robben Island, Cape Colony; and many others. On the subject of leprosy there are no higher authorities.” —Dr. William Tebb, MD, MA, DPH, “A Century of Vaccination and What It Teaches”, 1898
Eczema from vaccination.

“When Jenner died in 1823, three kinds of smallpox vaccines were in use: 1) cowpox promoted as ‘pure lymph from the calf,’ 2) horsegrease promoted as ‘the true and genuine life-preserving fluid,’ and 3) horsegrease cowpox...Following Jenner’s death the vaccine establishment used one excuse after another to
explain the failure of vaccination: the number of punctures was incorrect, or that revaccination was necessary or that the lymph was impure. The smallpox deaths of vaccinated patients in hospital were recorded as ‘pustular eczema.’” —Dr. Jennifer Craig, BSN, MA, PhD, “Smallpox Vaccine: Origins of Vaccine Madness”, 2010

In the 1800s, vaccination was associated with “blood poisoning.”

Edward Jenner, credited with inventing vaccination, borrowed the idea from dairymaids. Therefore, vaccination was founded upon superstition. This subject is discussed in detail in the books of the “History of Vaccination” series. One of the most prominent physicians at the time did not have nice things to say about Edward Jenner.

“Now this man Jenner had never passed a medical examination in his life. He belonged to the good old times when George III was King, when medical examinations were not compulsory. Jenner looked upon the whole thing as a superfluity. It was not until twenty years after he was in practice that he thought it advisable to get a few letters after his name. Consequently he communicated with a Scotch university and obtained the degree of Doctor of Medicine for the sum of £15 and nothing more...What Jenner discovered, though hardly original in its general principle, was that it pays far better to scare 100% of the fools in the world, the vast majority, into buying vaccine than it does to treat the small minority who really get smallpox and who cannot afford to pay anything. It was indeed a very great discovery worth thousands of millions. That is why this kind of blackmail is still kept going.” —Dr. Walter Hadwen, JP, MD, LRCP, MRCS, LSA

**Louis Pasteur and Attenuated Vaccines**

Louis Pasteur (1822-1895) co-developed the anthrax vaccine in 1881. The vaccine supposedly worked in cows, goats, and sheeps, but was not successfully tested in humans at the time. In 1885, Pasteur created the first human vaccine. This vaccine used attenuated (weakened) viruses as the primary ingredient.

**Virus:** An infective agent that typically consists of a nucleic acid molecule in a protein coat, is too small to be seen by light microscopy, and is able to multiply only within the living cells of a host.
**Anthrax:** A notifiable bacterial disease of sheep and cattle, typically affecting the skin and lungs. It can be transmitted to humans, causing severe skin ulceration or a form of pneumonia (also called wool-sorter's disease).

**Attenuate:** Reduce the virulence of (a pathogenic organism or vaccine). (Source: Google Dictionary).

**Louis Pasteur (1822-1895) of France.** He created the first attenuated (weakened) live virus vaccine. A few decades after his invention, cowpox, a disease from cows, would no longer be used as the main ingredient in the smallpox vaccine. Instead, weakened live viruses from animals would be used instead.

Louis Pasteur originally took a live virus from a rabbit’s spinal cord and attenuated the virus in a lab. This was the first rabies vaccine. This attenuated virus was supposedly maintained with preservatives and stabilizers such as formaldehyde and mercury, which are two of the most poisonous substances to the human body. Then the preserved attenuated live virus was later injected into
the human body to “prevent” disease—inject disease into the body to prevent disease. This defies common sense and logic.

Louis Pasteur’s theory of attenuated viruses opened the floodgates for the drug companies to create a multitude of other vaccines. Thus, began the modern era of vaccines for the drug companies. In 2018, Sanofi Pasteur was one of the largest vaccine manufacturers in the world.

MODERN VACCINE INGREDIENTS. Modern vaccines ingredients are very similar to each other. The few differences in vaccine ingredients depend on the type of vaccine. There are four main types of vaccines:

1) Live, attenuated vaccine.
2) Inactivated/killed vaccine.
3) Toxoid (inactivated toxin).
4) Subunit/conjugate.

Live, Attenuated vaccine: An attenuated vaccine is a vaccine created by reducing the virulence of a pathogen, but still keeping it viable (or "live"). Attenuation takes an infectious agent and alters it so that it becomes harmless or less virulent. These vaccines contrast to those produced by "killing" the virus (inactivated vaccine).

Inactivated vaccine: An inactivated vaccine is a vaccine consisting of virus particles, bacteria, or other pathogens that have been grown in culture and then killed using a method such as heat or formaldehyde.

Subunit/conjugate vaccine: A conjugate vaccine is created by covalently attaching a poor antigen to a strong antigen thereby eliciting a stronger immunological response to the poor antigen. Most commonly, the poor antigen is a polysaccharide that is attached to strong protein antigen. (Source: wikipedia.org)
Modern vaccine ingredients contain some of the most poisonous substances to the human body. Many of these toxins are summarized below.

**MODERN VACCINE INGREDIENTS AND THEIR EFFECTS ON THE BODY**

**ALUMINUM.** Known to cause brain damage at all doses, linked to ALZHEIMER’S DISEASE, dementia, seizures, autoimmune issues, SIDs and cancer. This toxin accumulates in the brain and causes more damage with each dose.

**BETA-PROPIOLACTONE.** Known to cause CANCER. Suspected gastrointestinal, liver, nerve and respiratory, skin and sense organ POISON.

**GENTAMICIN SULPHATE & POLYMYXIN B [ANTIBIOTICS].** Allergic reactions can range from mild to life-threatening.

**GENETICALLY MODIFIED YEAST, ANIMAL, BACTERIAL AND VIRAL DNA.** Can be incorporated into the recipient’s DNA and cause unknown GENETIC MUTATIONS.

**GLUTARALDEHYDE.** Poisonous if ingested. Causes BIRTH DEFECTS in animals.

FORMALDEHYDE [FORMALINE]. Known to cause CANCER in humans. Probable gastrointestinal, liver, respiratory, immune, nerve and reproductive system POISON. Banned from injectables in most European countries.

LATEX RUBBER. Can cause life-threatening allergic reactions.

HUMAN AND ANIMAL CELLS. Human DNA from aborted BABIES. Pig blood, horse blood, rabbit brains, dog kidneys, cow hearts, monkey kidneys, chick embryos, calf serum, sheep blood & more. Linked to childhood leukemia and diabetes.

MERCURY [THIMEROSAL]. One of the most toxic substances known. Even if a thermometer breaks, the building is cleared and HAZMAT is called. Tiny doses cause damage to the brain, gut, liver, bone marrow, nervous system and/or kidneys. Linked to autoimmune disorders, and neurological disorders like AUTISM.

MONOSODIUM GLUTamate [MSG]. A toxic chemical that is linked to birth defects, developmental delays and infertility. Banned in Europe.

NEOMYCIN SULPHATE [ANTIBIOTIC]. Interferes with vitamin B6 absorption which can lead to epilepsy and brain damage. Allergic reactions can range from mild to life-threatening.

PHENOL/PHENOXYETHANOL [2-PE]. Used as anti-freeze. TOXIC to all cells and capable of destroying the immune system.

POLYSORBATE 80 & 20. Known to cause CANCER in animals and linked to numerous autoimmune issues and infertility.

TRI(N) BUTYLPHOSPHATE. Potentially toxic to the kidney and nervous system.

DISEASES CAUSED BY MODERN VACCINE INGREDIENTS

We’ve seen the diseases caused by vaccines when their ingredients were diseases from animals—mainly pus and pox. The diseases caused by modern vaccine ingredients are also extensive. These diseases are the side effects of many vaccines, and are listed on the product inserts provided by the drug companies. These product inserts are usually 10 to 30 pages long, and not the one page printout pharmacies and doctors provide when you ask. Furthermore, these diseases, even death, are corroborated by millions of parents who’ve reported their experiences with vaccines. They’re listed on the VAERS (Vaccine Adverse Event Reporting System) database.

"Everyone who is vaccinated is vaccine injured—whether it shows up right away or later in life." —Dr. Shiv Chopra, B.V.S., A.H., M.Sc., PhD, Fellow of the World Health Organization, former senior scientist at Health Canada
The MMR (measles, mumps, rubella) combo vaccine product insert listing all the known side effects (adverse reactions) of the vaccine. Used under the Fair Use Clause.

The Dtap (diphtheria, tetanus, and whooping cough (pertussis)) vaccine insert listing all the known side effects.

Due to their similar ingredients, most modern vaccines have similar side effects.
Let’s look at the adverse reactions (side effects) of the MMR combo vaccine.

**ADVERSE REACTIONS (SIDE EFFECTS) ON DIFFERENT BODY PARTS**

**BODY AS A WHOLE.** Panniculitis; atypical measles; fever; syncope; headache; dizziness; malaise; irritability.

**CARDIOVASCULAR SYSTEM.** Vasculitis.

**DIGESTIVE SYSTEM.** Digestive system.

**ENDOCRINE SYSTEM.** Diabetes mellitus.

**HENAIC AND LYMPHATIC SYSTEM.** Thrombocytopenia (see WARNINGS, leukocytosis).

**IMMUNE SYSTEM.** Anaphylaxis and anaphylactoid reactions have been reported as well as related phenomena such as angioneurotic edema (including peripheral or facial edema) and bronchial spasm in individuals with or without an allergic history.

**MUSCULOSKELETAL SYSTEM.** Arthritis; arthralgia; myalgia.

Arthralgia and/or arthritis (usually transient and rarely chronic), and polyneuritis are features of infection with wild-type rubella and vary in frequency and severity with age and sex, being greatest in adult females and least in prepubertal children. This type of involvement as well as myalgia and paresthesia, have also been reported following administration of MERUVAX II.

Chronic arthritis has been associated with wild-type rubella infection and has been related to persistent virus and/or viral antigen isolated from body tissues. Only rarely have vaccine recipients developed chronic joint symptoms.

Following vaccination in children, reactions in joints are uncommon and generally of brief duration. In women, incidence rates for arthritis and arthralgia are generally higher than those seen in children (children: 0-3%; women: 12-26%),\{17,56,57\} and the reactions tend to be more marked and of longer duration. Symptoms may persist for a matter of months or on rare occasions for years. In adolescent girls, the reactions appear to be intermediate in incidence between those seen in children and in adult women. Even in women older than 35 years, these reactions are generally well tolerated and rarely interfere with normal activities.

**NERVOUS SYSTEM.** Encephalitis; encephalopathy; measles inclusion body encephalitis (MIBE) (see CONTRAINDICATIONS); subacute sclerosing panencephalitis (SSPE); Guillain-Barré Syndrome (GBS); acute disseminated encephalomyelitis (ADEM); transverse myelitis; febrile convulsions; afebrile convulsions or seizures; ataxia; polyneuritis; polyneuropathy; ocular palsies; paresthesia.

Encephalitis and encephalopathy have been reported approximately once for every 3 million doses of M-MR II or measles-, mumps-, and rubella-containing vaccine administered since licensure of these vaccines.
The risk of serious neurological disorders following live measles virus vaccine administration remains less than the risk of encephalitis and encephalopathy following infection with wild-type measles (1 per 1000 reported cases).\(^{58,59}\)

In severely immunocompromised individuals who have been inadvertently vaccinated with measles-containing vaccine; measles inclusion body encephalitis, pneumonitis, and fatal outcome as a direct consequence of disseminated measles vaccine virus infection have been reported (see CONTRAINDICATIONS). In this population, disseminated mumps and rubella vaccine virus infection have also been reported.

There have been reports of subacute sclerosing panencephalitis (SSPE) in children who did not have a history of infection with wild-type measles but did receive measles vaccine. Some of these cases may have resulted from unrecognized measles in the first year of life or possibly from the measles vaccination. Based on estimated nationwide measles vaccine distribution, the association of SSPE cases to measles vaccination is about one case per million vaccine doses distributed. This is far less than the association with infection with wild-type measles, 6-22 cases of SSPE per million cases of measles. The results of a retrospective case-controlled study conducted by the Centers for Disease Control and Prevention suggest that the overall effect of measles vaccine has been to protect against SSPE by preventing measles with its inherent higher risk of SSPE.\(^{60}\)

Cases of aseptic meningitis have been reported to VAERS following measles, mumps, and rubella vaccination. Although a causal relationship between the Urabe strain of mumps vaccine and aseptic meningitis has been shown, there is no evidence to link Jeryl LynnTM mumps vaccine to aseptic meningitis.

**RESPIRATORY SYSTEM.** Pneumonia; pneumonitis (see CONTRAINDICATIONS); sore throat; cough; rhinitis.

**SKIN.** Stevens-Johnson syndrome; erythema multiforme; urticaria; rash; measles-like rash; pruritis.

Local reactions including burning/stinging at injection site; wheal and flare; redness (erythema); swelling; induration; tenderness; vesication at injection site; Henoch-Schönlein purpura; acute hemorrhagic edema of infancy.

**SPECIAL SENSES—EAR.** Nerve deafness; otitis media.

**SPECIAL SENSES—EYE.** Retinitis; optic neuritis; papillitis; retrobulbar neuritis; conjunctivitis.

**UROGENITAL SYSTEM.** Epididymitis; orchitis.

OTHER. Death from various, and in some cases unknown, causes has been reported rarely following vaccination with measles, mumps, and rubella vaccines; however, a causal relationship has not been established in healthy individuals (see CONTRAINDICATIONS). No deaths or permanent sequelae were reported in a published post-marketing surveillance study in Finland involving 1.5 million children and adults who were vaccinated with M-M-R II during 1982 to 1993.\(^{61}\)

Under the National Childhood Vaccine Injury Act of 1986, health-care providers and manufacturers are required to record and report certain suspected adverse events occurring within specific time periods after vaccination. However, the U.S. Department of Health and Human Services (DHHS) has established a Vaccine Adverse Event Reporting System (VAERS) which will accept all reports of suspected events.\(^{49}\)
A VAERS report form as well as information regarding reporting requirements can be obtained by calling VAERS 1-800-822-7967.

**2018 MMR vaccine insert, Merck & Co—used under the Fair Use Clause.** Vaccine adverse reactions affect every part of the body. It is estimated that only a fraction of adverse reactions are reported since pediatricians and doctors advise parents that side effects are a coincidence or are “normal”.

In their 8 to 12 years of medical education, medical doctors (MDs) and pediatricians receive only a few hours of vaccine training. They are *not* educated on vaccine ingredients or vaccine side effects. Those few hours are spent “educating” them on how to get parents to adhere to the CDC childhood vaccine schedule, which as of 2018, recommends that a child receive 74 vaccines (some are combos) by the time they’re 18 years old.

That’s a lot of poison in a child. As vaccine doses increased, so did the autism rate (brain damage). The heavy metals in vaccines have been implicated in causing the autism epidemic.

“I am no longer ‘trying to dig up evidence to prove’ vaccines cause autism. There is already abundant evidence. This debate is not scientific but is political.”
—Dr. David Ayoub, MD, radiologist

“The CDC is not an independent agency. It is a vaccine company. The CDC owns over 20 vaccine patents. It sells about $4.6 billion of vaccines every year...Four scathing federal studies, including two by Congress, one by the U.S.
Senate, and one by the HHS Inspector General, paint the CDC as a cesspool of corruption, mismanagement and dysfunction with alarming conflicts of interest suborning its research, regulatory and policymaking functions...Doctors are punished by insurance companies like Blue Cross and Blue Shield if doctors don’t get a certain percentage of their patients to comply with the vaccination schedule. If 63% are non-compliant, they don’t receive any of their bonuses.” — Robert F. Kennedy, Jr.

Furthermore, medical doctors receive roughly 8 hours of nutrition training. Medical doctors and pediatricians have been indoctrinated into the medical industry. They are no longer independent healers, but merely clerks and salespeople for the drug companies.

DO VACCINES CAUSE AUTISM?

Demanding "scientific studies" to question vaccination is a method of sophistry (the use of fallacious arguments, especially with the intention of deceiving), particularly whether vaccines cause autism. Heavy metals cause brain damage. Heavy metals (aluminum, mercury derivatives) are in vaccines. Once injected into the muscles, the heavy metals are absorbed into the bloodstream and reach the brain. Children are injected with heavy metals. Children have a high rate of autism. Do vaccines cause autism? No. The heavy metals in vaccines cause autism.

Autism is a form of brain damage. Whether the drug companies reclassify or rename autism, at its root autism is still brain damage. Like polio, the drug companies may decide to reclassify or rename autism in the future. The drug industry often play a game of semantics:

1) Reclassify a disease by adding or removing symptoms. This gives the appearance that the disease was eradicated. Also, reclassify an illness as a disease to make it more menacing (eg, reclassify measles as a disease).

2) Rename a disease. This also gives the appearance that the disease was eradicated.

The most common adverse reactions of most vaccines are allergies, asthma, brain damage, cancer, autoimmune diseases, and even death. However, there are more than 100 autoimmune diseases. Some of the more common autoimmune
diseases are:

Immune system disorders, Rheumatoid arthritis, lupus, Inflammatory bowel disease (IBD), Multiple sclerosis (MS), Type 1 diabetes mellitus, Guillain-Barre syndrome (paralysis), Chronic inflammatory demyelinating polyneuropathy, Psoriasis, Graves' disease, Hashimoto's thyroiditis, Myasthenia gravis, Vasculitis.

“Vaccines are unavoidably unsafe.” —US Supreme Court, March 2011

From 1986-2017, the vaccine injury court has paid over $3.7 billion dollars to vaccine injured parents, proving vaccines are not safe. The historical data shows vaccines were ineffective at preventing diseases. Therefore, the only rational conclusion is that vaccines are unsafe and ineffective.

HOW VACCINES CAUSE DISEASES IN DIFFERENT PARTS OF THE BODY

Vaccine ingredients are not injected directly into the bloodstream—they are injected indirectly into the bloodstream. The ingredients are injected into the muscles (intramuscular injection/intramuscularly). Then the ingredients are absorbed into the bloodstream. Through the muscular system and bloodstream (circulatory system), the toxins in vaccines reach every part of the body.
The bloodstream is part of the circulatory system. When vaccine ingredients are injected into the muscles and absorbed into the bloodstream, the toxins are capable of reaching every part of the body through the muscular and circulatory systems.

– Through the bloodstream (part of the circulatory system), the toxins can pollute the blood cells (blood poisoning), causing cancer and autoimmune diseases.

– Through the muscular system, the toxins can cause paralysis (Guillain-Barré syndrome, GBS) and other muscular abnormalities.

– Through the bloodstream, the toxins can travel to the brain and cross the blood-brain-barrier, causing brain damage.

These are the mechanics in which vaccines cause various diseases throughout the body. Vaccine ingredients have constantly changed since 1796. The only constant is the theory of vaccination: inject poisons, viruses, and diseases into the body to prevent disease.

As bizarre and unbelievable as it sounds, the theory of vaccination is to inject poisons, viruses, diseases into the body in order to prevent disease. How can something that causes a long list of diseases be used to prevent disease? Something intended to prevent disease shouldn’t cause more diseases than it’s supposed to prevent. It defies common sense and logic.

SMALLPOX, INOCULATION, VACCINATION

To understand why vaccination came about, we need to examine the most horrific and feared disease in history: smallpox.

The first vaccine was conceptualized in 1796 by Edward Jenner of England to prevent smallpox. Prior to vaccination, inoculation (very similar to vaccination) was used to prevent smallpox. Thus, smallpox, inoculation, and vaccination are intertwined.
Smallpox was the most feared disease in history because of the distinct bodily marks (pox) it left on victims. Photo: www.wikipedia.org

SMALLPOX

1) “An acute, highly contagious, febrile disease, caused by the variola virus, and characterized by a pustular eruption that often leaves permanent pits or scars: eradicated worldwide by vaccination programs.” —www.dictionary.com

2) An acute contagious viral disease, with fever and pustules usually leaving permanent scars. It was effectively eradicated through vaccination by 1979.” —Google Dictionary

3) “Thousands of years ago, variola virus (smallpox virus) emerged and began causing illness and deaths in human populations, with smallpox outbreaks occurring from time to time. Thanks to the success of vaccination, the last natural outbreak of smallpox in the United States occurred in 1949. In 1980, the World Health Assembly declared smallpox eradicated (eliminated), and no cases of naturally occurring smallpox have happened since...Smallpox research in the United States continues and focuses on the development of vaccines, drugs, and diagnostic tests to protect people against smallpox in the event that it is used as an agent of bioterrorism.” —www.cdc.gov

Consider this: There were roughly 200 nations on Earth when smallpox was supposedly ravaging the planet. Of those, only about 30 nations were ever vaccinated for smallpox. But it was declared eradicated by vaccination when about 170 countries never used the smallpox vaccine. If they did, it was only in the vast minority of their populations. Furthermore, smallpox was foreign to the North American Indians. The Natives lived in open spaces and managed to avoid the dreaded smallpox. Only when the Europeans arrived in the 16th century was smallpox introduced to the Americas. In the next three centuries, the Europeans used smallpox as a biological weapon to nearly wipe out the North American Indians.

As you’ll soon discover, every historical data has shown that vaccination never eradicated smallpox. In fact, vaccination increased the incidence of smallpox wherever it was practiced.

INOCULATION
Inoculation is the practice of creating a cut in the body, usually the arm, to insert animal pus, human smallpox, or another disease into the cut. This was done in hopes of preventing disease, particularly smallpox. The ancient Hindus purportedly practiced inoculation several hundred years prior to the introduction of vaccination in 1796. Inoculation was the predecessor to vaccination, both are based on the theory of homeopathy: In small doses, like cures like. For example, rubbing small doses of smallpox into a person to prevent smallpox.

"Dhanwantari, the Vedic Father of Medicine, and the earliest known Hindu physician, who lived about 1,500 B.C., is supposed to have been the first to practice inoculation for smallpox. It is even stated that the ancient Hindus employed a vaccine, which they prepared by the transmission of the smallpox virus through a cow." —“History of Inoculation and Vaccination”, p. 6-13
introducing it into another person through a cut in the arm.

“The practice of inoculation spread like a noxious weed, from the savage tribes of the forgotten past into the civilizations of Africa, Arabia, Tibet, India and finally into Europe and America.” —Dr. Eleanor McBean, PhD, ND, “The Poisoned Needle”, 1957

VACCINATION
The practice of introducing, often through injection, poisons, viruses, and diseases into the body to prevent disease. The first vaccine (smallpox vaccine) was conceptualized by Edward Jenner of England in 1796 and later used on the English in the early 1800s. The first smallpox vaccine primarily used cowpox, a cow disease, to vaccinate against smallpox, a human disease.
Vaccination against smallpox. A painting of Edward Jenner applying the smallpox vaccine (cowpox in a needle) to a child.

When Louis Pasteur created the attenuated (weakened) live virus vaccine in 1885, it opened the floodgates for drug companies to manufacture all sorts of vaccines: flu (influenza), measles, chickenpox, polio, etc.

The question is, “Did vaccination prevent or eradicate smallpox?” According to official statistics, the answer is NO. Vaccination did not prevent or eradicate smallpox.

“It is clear that the mortality from both causes fell very remarkably, and that in the case of smallpox as well as in the case of ‘other zymotics’ the decline had set
in before the end of the eighteenth century—in other words before the beginning of the vaccination era.” — Dr. C. Killick Millard, M.D., D.Sc., “The Vaccination Question in the Light of Modern Experience”, 1914, chap. 2

Mortality from smallpox and other zymotic (infectious, contagious) diseases in London, 1760 to 1910. Official statistics from the Registrar General, England 1760-1910. From this historical data we know that vaccines had no role in preventing zymotic (infectious, contagious) diseases. Vaccines did not eradicate smallpox.

“Vaccination is utterly useless as a preventive against smallpox, that millions of vaccinated persons have died of smallpox.” —Dr. J.W. Hodge, MD, New York

“I know of one epidemic of smallpox comprising nine hundred and some cases in which 95% of the infected had been vaccinated, and most of them recently. I have had in my own experience on very small epidemic comprising 33 cases, of which 29 had vaccination histories a ‘good’ scar, and some of them vaccinated within the last year. There was no protection there.” —Dr. William Howard Hay, 1937
“Vaccination has not protected us; it could not do it, because the smallpox had already left us and the non-vaccinated world, before its introduction...Vaccination proves itself, in the history of humanity, to be the greatest crime committed in this last century!” —Dr. C. Charles Schieferdecker, MD, “The Evils of Vaccination”, 1856

“Smallpox attained its maximum mortality after vaccination was introduced. The mean annual mortality for 10,000 population from 1850 to 1869 was at the rate of 2.04, whereas after compulsory vaccination, in 1871 the death rate was 10.24. In 1872 the death rate was 8.33 and this after the most laudable efforts to extend vaccination by legislative enactments.” —Dr. William Farr (1807-1883), Compiler of Statistics of the Registrar General of London

A BRIEF HISTORY OF SMALLPOX
One of the medical profession’s greatest boasts is that it eradicated smallpox through the use of the smallpox vaccine. I myself believed this claim for many years. But it simply isn’t true.” —Dr. Vernon Coleman, MB, ChB, DSc, FRSA, GP, Anyone Who Tells You Vaccines Are Safe And Effective Is Lying. Here's The Proof, 2011

Smallpox had been mentioned in different civilizations, from the ancient Egyptians, Aztecs, and Chinese. However, there were no smallpox epidemics recorded in ancient times that could be verified. Smallpox epidemic numbers were only accurately recorded in England from the 1700s to the 1900s. Therefore, because of the lack of official smallpox records and statistics in the English-speaking world, only the records from England are considered reliable. Anything else is, without official data, is pure speculation.

“It is a matter of pure speculation as to when the condition first appeared, but it is unlikely to have done so prior to man’s establishment of large townships coupled with poor nutrition, overcrowding, lack of sanitation and inadequate hygiene. Keeping people, such as slaves and prisoners, in disgusting and sub-human conditions may have been the necessary ingredient for the establishment of the virus but there is virtually no doubt that the aforementioned adverse conditions were responsible for the epidemics of smallpox as well as for its endemic nature in certain areas until its recent demise. It was recorded in Chinese history and was certainly prevalent in the west by the sixteenth century.” —Dr. Michael Nightingale, Traditional Chinese Medicine
The deaths caused by smallpox were greatly exaggerated (disease mongering), even fabricated, in medical textbooks and in general. For example,

“Queen Mary II of England died of smallpox in 1694. In the century following her death 60 million persons in Europe died of smallpox.” —Howard Haggard, “Devils, Drugs, and Doctors”, 1929

However, Mr. Haggard’s assertion is refuted by Dr. Jennifer Craig (BSN, MA, PhD), “The population of Europe was 130 million in 1762 and 175 million in 1800. The death rate from smallpox in that period was 18.5%. If 60 million deaths occurred with an 18.5% death rate then it would require 319,148,936 cases of smallpox in Europe and that would be 144,148,936 more cases of smallpox than there were people living in Europe at the close of the 18th century.”

Again, vaccination is a fraud based on fear, greed, and revisionist history.

The Eradication of Diseases

In the 21st century, there should be no need for anyone in developed countries to fear catching diseases that people contracted in the 1700, 1800, and early 1900s. Back then, the living and working condition of the masses were breeding grounds for diseases. They lacked clean-running water, electricity, garbage collection, and modern buildings. They defecated and urinated in their backyards. It wasn’t vaccines that eradicated diseases but sanitation, hygiene, especially the modern amenities that we take for granted today. As examples, soap, toilet paper, paper towel, toothbrush, shampoo, washing machine, shower, and supermarket. In developed countries, all these conveniences were available to the masses in the 1960s. These modern amenities significantly contributed to the increased standard of living and especially to the eradication of diseases.

You do not live like people used to, therefore you should not worry about contracting diseases that people used to contract.
Infectious diseases spread predominantly in overcrowded, unsanitary conditions. People used to defecate and urinate in their backyards. They fetched dirty water from rivers for drinking and washing. They buried potatoes in the ground in winter to preserve them. Animal manure was common in the streets. They burnt wood and coal for heating and breathed in the fumes. These were the perfect breeding grounds for diseases. Disease rates in children were high because they worked in fields and unsafe factories.
Working and living conditions were inhumane and breeding grounds for diseases in the 18th and 19th centuries. Workers were known as peasants and
serfs. Debtor prison and indentured servitude were common. The conditions were so horrific and unjust that communism was invented to create workers’ rights.

The eradication of diseases was primary due to sanitation and hygiene. For those who think otherwise, ask them to live without clean-running water, electricity, and garbage collection. They will not do it because they cannot imagine life without them—because it was those amenities that eradicated infectious diseases.

“Sanitation did for Prussia what 35 years of compulsory vaccination was unable to accomplish. At the present time in Prussia, smallpox is almost extinct. It is not that people are being vaccinated more; they are vaccinated less.” —Dr. Walter R. Hadwen, MD, 1896, “The Case Against Vaccination”

“There is no question that perfect sanitation has almost obliterated this disease (smallpox), and sooner or later will dispose of it entirely. Of course, when that time comes, in all probability the credit will be given to vaccination.” —Dr. John Tilden (1851-1940), MD
**Sewer systems, plumbers, electricity**, garbage men, architects, engineers, and advances in manufacturing technology extended lives and eradicated diseases. Graph compiled from: Australian Institute of Health and Welfare (AIHW) 2010. GRIM (General Board of Incidence of Mortality) Books; Original author Dr. Paul Jelfs, updated by Karen Bishop.

“The most widespread and lethal diseases in the last 200 years were reduced due cleaner drinking water, improved sanitation, nutrition, less overcrowded areas, and better living conditions. Vaccines were introduced at the point were every single disease was already declining. To give vaccines credit for global reductions in disease is like giving a band-aid credit for healing a wound that was already closing.” —Dr. Dave Mihalovic, ND

“The largest historical decrease in morbidity and mortality caused by infectious disease was experienced not with the modern antibiotic and vaccine era, but after the introduction of clean water and effective sewer systems.” —The Journal of Pediatrics, December 1999, Vol. 135, No. 6, p. 663

The modern amenities (mainly clean-running water, electricity, garbage collection, modern buildings) that eradicated diseases also extended our life expectancy. Modern medicine, despite what the drug companies claim, had no role in eradicating diseases or prolonging life. If anything, synthetic drugs and vaccines have shortened the lives of millions. Doctors and hospitals are the 3rd leading cause of death in the USA. Some have claimed that the medical system is actually the 1st leading cause of death because the vast majority of those who have died of heart attacks, cancer, and diabetes were on medication or chemotherapy—they were involved in the medical system. The reason is that the ingredients in drugs, vaccines, and chemotherapy are toxins and poisons to the body.

**THE DEADLIEST DISEASES WERE ERADICATED WITHOUT VACCINES**

The deadliest disease epidemic in history, the Black Death (Plague), was eradicated without vaccines. The second deadliest disease epidemic in history, the Spanish Flu, was believed to be caused by vaccines.

Many diseases disappeared on their own, without the need for vaccines. The
deadliest infectious diseases in history were eradicated through prevention, quarantine and isolation, and removing the causes. As examples, the Black Death (Plague) and Spanish Flu.

“The Black Death was one of the most devastating pandemics in human history, resulting in the deaths of an estimated 75 to 200 million people in Eurasia and peaking in Europe in the years 1346–1353...In the Late Middle Ages (1340–1400) Europe experienced the most deadly disease outbreak in history when the Black Death, the infamous pandemic of bubonic plague, hit in 1347, killing a third of the human population.” —www.wikipedia.org

THE BUBONIC PLAGUE was believed to be caused by rodents, particularly rats, transferring their diseases to humans. These rodents were moved freely between countries during wars, trades, and travels. The rodents, unknown to humans, contaminated the food and water supplies. Today, we have rodent control programs administered by public health departments and the movement of animals are strictly controlled when travelling between countries. In summary, one of the worst pandemics in history was eradicated without vaccines. Diseases are eradicated when their causes are removed.

THE 1918 INFLUENZA PANDEMIC (Spanish Influenza). There are many speculations as to what caused the 1918 flu pandemic.

“The 1918 flu pandemic (January 1918–December 1920) was an unusually deadly influenza pandemic, the first of the two pandemics involving H1N1 influenza virus. It infected 500 million people around the world, including remote Pacific islands and the Arctic, and resulted in the deaths of 50 to 100 million (three to five percent of the world's population), making it one of the deadliest natural disasters in human history.” —www.wikipedia.org

The Spanish blamed it on the French and called it the French Flu. Some say it originated in China, some say in German as a biological weapon. However, the most credible theory was that the 1918 flu pandemic was caused by vaccines, most likely the experimental typhoid or flu vaccine.

“It was a common expression during the war that ‘more soldiers were killed by vaccine shots’ than by shots from enemy guns.” —Dr. Eleanor McBean, PhD, ND, “The Poisoned Needle”
“In 1918, the US Army forced the vaccination of 3,285,376 natives in the Philippines when no epidemic was brewing, only the sporadic cases of the usual mild nature. Of the vaccinated persons, 47,369 came down with smallpox, and of these 16,477 died. In 1919 the experiment was doubled. 7,670,252 natives were vaccinated. Of these 65,180 victims came down with smallpox, and 44,408 died. In the first experiment, one-third died, and in the second, two-thirds of the infected ones died.” —Dr. William F. Koch, MD, PhD, “The Survival Factor in Neoplastic and Viral Diseases”

“The 1918 ‘Spanish Flu’ started in American military Camp Funston, Fort Riley, USA, amongst troops making ready for WWI—taking on board vaccinations, recruit training and all. It eventually killed about 40,000,000 people worldwide. That flu strain only appeared briefly once again, according to the US Atlanta CDC. This was in 1976 and again it struck at the US army camp Fort Dix, USA, amongst recently vaccinated troops (and no one else EVER); Fort Dix is known to have been a vaccine trial centre. Was the world’s greatest ‘influenza’ scourge another well-hidden vaccine disaster?” —John P. Heptonstall, Director of Morley Acupuncture Clinic and Complementary Therapy Centre, West Yorkshire
Influenza and Pneumonia death rates spiked between 1918-1920. World War I was the first war in which US service men were required to vaccinate. The high vaccination rate before the flu pandemic of 1918-1920 was the most likely cause of the flu pandemic.

“Typhoid vaccines were available by World War I, and the U.S. Army made getting those shots mandatory for all its enlisted soldiers.” —Susan Perry, “Medical lessons from World War I underscore need to keep developing antimicrobial drugs”, 2014
Typhoid fever began its sharp decline after World War I, when US soldiers were no longer vaccinated.

Despite all the evidence, one infectious-disease epidemiologist, Dr. G. Dennis Shanks, stated that typhoid vaccination “was thought to be a genuine medical success story.” Add his opinion to the Vaccination Nuttery pile.

The Spanish Flu should had been called The USA Flu. The Americans probably called it the Spanish Flu to scorn Spain for the Spanish-American War of 1898. In any case, the flu pandemic disappeared on its own without the need for vaccination (or more vaccination). Again, history has shown that when the causes are removed, diseases are eradicated. In the 21st century, people living in developed countries should have no fear of polio, smallpox, measles, whooping cough, and other infectious diseases. Vaccines are not the natural causes of infectious diseases; therefore, they cannot prevent them. Prevention and eradication can only be attained by removing the causes.
DEATH BY MEDICINE. Healthcare (deathcare) is a business. Drug companies, hospitals, medical doctors, and pediatricians are all part of the "sick care" system. As Bill Maher commented, "There's no money in healthy people, and there's no money in dead people. The money is in the middle: people who are alive, sort of, but with one or more chronic conditions." The poisons in vaccines are remarkably efficient at creating chronic illnesses and diseases.

"Of recent years, many men and women in prime of life, have dropped dead suddenly. I am convinced that some 80% of these deaths are caused by the inoculations or vaccinations they have earlier undergone. These are well known to cause grave and permanent disease of the heart. The coroner always hushes it up as ‘natural causes’. I have been trying to get these cases referred to an Independent Commission of inquiry, but so far, in vain." —Dr. Herbert Snow, MD, 25 year staff surgeon of the London Cancer Hospital, 1954

“What miserable fellows our descendants are; each of them requires more of medical attendance in one year, than I had in my whole life!” —Dr. C.G.G. Nittinger, “The Evils of Vaccination”, 1856

"Medical science has made such tremendous progress that there is hardly a healthy human left." —Aldous Huxley, 1894–1963

WHAT ABOUT POLIO?

"Polio is NOT even contagious or infectious (never proven to be). There is NO proof Polio is caused by a virus. There is NO evidence that anyone caught polio from another person in the family. There is NO evidence that any nurse or doctor caught polio from a patient." —Sheri Nakken, RN, MA

Polio is disease used to describe the effects of poisoning from manmade chemicals, especially those found in pesticides and vaccine ingredients. Therefore, polio is a manmade disease caused by pesticides and vaccines. This is how the vaccination nuttery works: the polio vaccine causes polio and the drug companies insist everyone get vaccinated with the polio vaccine to prevent polio. But they don’t tell you that the polio vaccine causes polio. Furthermore, they credit the polio vaccine for eradicating polio, when the vaccine actually caused polio.
A distinct symptom of polio is paralysis. In all of history, there has never been a case of an infant born severely paralyzed that can be verified. If you read drug company literature, it points to ancient Egyptian and Aztec paintings depicting paralyzed individuals. This is not proof that polio has been around since ancient times. There are many causes of paralysis: accidents, injuries in war, surgery, mutilation, neurotoxic chemicals, and so forth. Polio was not an infectious disease but a manmade disease.

Three polio facts:

1) Nearly all recorded polio cases between 1940 and 1970 were caused by the Salk polio vaccine, the pesticide DDT, and other pesticides. Wild polio was and is extremely rare. Polio was not an infectious disease but a manmade disease.

2) The Salk polio vaccine was discontinued in the early 1970s because it was causing polio, cancer, and death in children. Today, the drug companies insist that the Salk polio vaccine saved humanity from polio. In 1972, before a Senate Committee hearing, polio vaccine inventor Jonas Salk testified that nearly all polio outbreaks since 1961 resulted from or were caused by the oral polio vaccine.

3) There is no such thing as a polio vaccine that can prevent polio. And no such thing as a vaccine that can prevent disease. There are over 150 years of data that proves vaccines are useless and poisonous.

Nearly all recorded polio cases in history were caused by manmade chemicals and the polio vaccine. From 1940 to 1972, the surest way to contract polio was to be exposed to the pesticide DDT or get vaccinated with the polio vaccine—the Salk polio vaccine caused polio, one reason it was discontinued. DDT was made by Monsanto, the same company responsible for Agent Orange, Aspartame, RoundUp, PCBs, Saccharin, and recently GMOs.
It could be said that the drug and chemical companies (specifically Monsanto) colluded to conceal the deaths caused by DDT by using polio as a cover.

For over 150 years, common words that independent doctors and scientists have used to describe vaccination are: useless, dangerous, scam, fraud, racket. A
Glorious example is polio. Polio (or the symptoms associated with polio) was not an infectious disease in the traditional sense as the vast majority are miseducated to believe. Many recorded polio cases between 1940 and 1970 were manmade, caused by the pesticide DDT (Dichloro Diphenyl Trichlorethane) and other pesticides. The remaining polio cases were caused by the polio vaccine. Wild polio was and is still rare.

Before the large scale use of DDT in the early 1940s, the word "polio" appeared 0 (zero) times in epidemiological (large population disease) studies between the 1700s to late 1800s. In other words, polio was rare in the USA until DDT's predecessor was used after 1874, then when DDT was widely used in the 1940s. After which, the polio epidemics started.

As the use of DDT significantly increased after 1940, the polio rate also increased proportionally. The largest polio epidemics in history occurred in the 1940s and 1950s. This timeline coincides with the DDT's wide scale use and the introduction of the Salk polio vaccine. DDT is a poison and a neurotoxin. It causes paralysis and brain/spinal cord disease—both are distinct symptoms of polio.

As the use of DDT decreased, the polio rate also decreased proportionally. DDT was banned in the USA in 1972 by the EPA (Environmental Protection Agency). After which, polio was reclassified—polio is magically a new disease now. Medical students are taught that the polio people had contracted in the 1940s to 1970s was an infectious disease. It wasn't.

Polio: "1789, British physician Michael Underwood provides first clinical description of the disease. 1840, Jacob Heine describes the clinical features of the disease as well as its involvement of the spinal cord."

There are many secondary causes of polio (the primary cause is the poliovirus). One secondary cause of the poliovirus was DDT and other pesticides. Another is unsanitary conditions, "Polio is usually spread via the fecal-oral route (i.e., the virus is transmitted from the stool of an infected person to the mouth of another person from contaminated hands or such objects as eating utensils). Some cases may be spread directly via an oral to oral route." Contaminated water was also cited as a secondary cause of the poliovirus. However, up until chemical pesticides were commonly used and the introduction of the Salk polio vaccine, wild polio was extremely rare.
The predecessor to DDT was first synthesized in 1874 and was used as a pesticide. Its successor, DDT, was commercialized in 1939 when the invention was credited to Paul Muller.

The first polio outbreak in the U.S. was in 1894 in Vermont, with 132 cases. Another in New York in 1916. The polio outbreaks of 1894, 1916, 1940s, and 1950s have an eerie commonality: they occurred in the summer, when DDT and other pesticides were being sprayed, especially in apple orchards. In addition, of the nearly 200 countries in the world, only countries that used DDT had polio outbreaks. And the higher the DDT usage, the higher the polio rate.
“So as DDT peaked, six months later, polio peaked. DDT comes down, six months later polio comes down. DDT flatlines, polio flatlines. It follows the contour. It’s like taking the same graph and just displacing it by six months.” — Dr. Rashid Buttar, DO
Texas, USA, 1950s. DDT was used as an insecticide, mostly to kill mosquitos. The big difference in body mass between insects and humans explains the different effects of DDT on both species. DDT kills insects, which have significantly less body mass than humans. In equal doses, DDT isn’t potent enough to kill humans but causes paralysis, which is a distinct symptom assigned to polio.

1953: Dr. Morton S. Biskind writes: “It was known by 1945 that DDT was stored in the body fat of mammals and appears in their milk...yet far from admitting a causal relationship between DDT and polio that is so obvious, which in any other field of biology would be instantly accepted, virtually the entire apparatus of communication, lay and scientific alike, has been devoted to denying, concealing, suppressing, distorting and attempts to convert into its opposite this overwhelming evidence. Libel, slander, and economic boycott have not been overlooked in this campaign.”

DDT was banned in 1972.Coincidentally, the Salk polio vaccine was discontinued in the same period because it was causing polio, cancer, and death in children.
The Cutter Incident, 1955. Polio vaccine manufacturer Cutter Laboratories caused 40,000 cases of polio.

“In April 1955 more than 200 000 children in five Western and mid-Western USA states received a polio vaccine in which the process of inactivating the live virus proved to be defective. Within days there were reports of paralysis and within a month the first mass vaccination programme against polio had to be abandoned. Subsequent investigations revealed that the vaccine, manufactured by the California-based family firm of Cutter Laboratories, had caused 40 000

From these timelines and events, it could be concluded that polio (or the symptoms associated with polio) was a manmade disease and not an infectious disease that medical students are taught. In other words, nearly all cases of polio were caused by pesticides, specifically DDT, and the Salk polio vaccine.

The polio vaccine might have caused cancer in millions of Americans. “SV40 is a virus found in some species of monkey...SV40 was discovered in 1960. Soon afterward, the virus was found in polio vaccine...More than 98 million Americans received on or more doses of polio vaccine from 1955 to 1963 when a proportion of vaccine was contaminated with SV40; it has been estimated that 10-30 million Americans could have received an SV40 contaminated dose of vaccine...SV40 has been found in certain types of cancer in humans...” —CDC (Centers for Disease Control and Prevention), “Simian Virus 40 (SV40), and Polio Vaccine Fact Sheet”, 2013

RE-NAMING AND RE-CLASSIFYING DISEASES TO ERADICATE THEM

If DDT and the Salk polio vaccine caused nearly all cases of polio, and they were banned in the early 1970s, why is there still polio after DDT and the Salk polio vaccine were discontinued? Polio has been given new symptoms (polio has been redefined and reclassified). It’s an entirely new disease with new symptoms. Some of these symptoms include fever or severe fatigue. Drug companies often reclassify or rename diseases to give the appearance that they’ve been eradicated, or they’re still a menace—depending which one meets their financial interest.

“The idea of re-naming a disease to suit the records is not new. Hadwen also said in his address, that in 1886, although there were 275 cases of smallpox, only one vaccinated child died. In addition, 93 children died of chicken pox. Given the mild nature of chickenpox and the fact that few deaths from it had previously been recorded, this diagnosis is highly unlikely...Re-naming the disease did the trick. They didn’t die of smallpox, they died of the re-named disease: spurious
Re-naming and re-classifying diseases is a scheme the drug companies often use to suit their needs.

–You can remove major symptoms of a disease and it’s magically eradicated.

–Or you can call it a different name and it’s magically eradicated.

In 2017, autism affects 1 in 36 children. Don’t be surprised if the drug companies re-name or re-classify autism so it’s no longer a problem to parents. At its root, autism is a form of brain damage, regardless of its name or assigned symptoms.

In the 21st century, nearly all infant and childhood illnesses and diseases can be traced back to vaccines. However, the drug companies are blaming those illnesses and diseases on genetic/congenital factors. This is an attempt to absolve the drug and chemical companies of legal and financial liabilities. Another way the drug and chemical companies attempt to absolve themselves of wrongdoing is to revise history (outright lies). These are not the people you want to trust with your children's health.

The chemical companies create diseases and the drug companies sell products that supposedly prevent those diseases. In reality, those drugs and vaccines (ingredients from chemical companies) actually cause more diseases—the left hand and right hand work together.

The Anti-Vaccination Movements

The anti-vaccination movement started when parents noticed that their children became diseased and dead after vaccination. Thus began the anti-vaccination movement in 1853 in England—1853 was also the first year of compulsory vaccination in England (also in 1867 and 1871). Each compulsory vaccination year was followed by an outbreak of the diseases the vaccines were supposed to prevent.

Formally, The Anti-Compulsory Vaccination League was launched in England in
1867. Then The London Society for the Abolition of Compulsory Vaccination. As vaccination moved to the US and Canada, the anti-vaccination movement also followed.

“The anti-vaccinists are those who have found some motive for scrutinizing the evidence, generally the very human motive of vaccinal injuries or fatalities in their own families or in those of their neighbours. Whatever their motive, they have scrutinized the evidence to some purpose, they have mastered nearly the whole case; they have knocked the bottom out of a grotesque superstition. The public at large cannot believe that a great profession should have been so perseveringly in the wrong.” —Dr. Charles Creighton, MA, MD, “Jenner and Vaccination: A Strange Chapter of Medical History”, 1889
England, 1853. An anti-vaccination poster from the 1850s. The anti-vaccination movement began in England in 1853 and continues into the 21st century. Vaccines exist to serve the drug companies, doctors, pediatricians, and hospitals.

“The vaccination practice, pushed to the front on all occasions by the medical profession, and through political connivance made compulsory by the state, has not only become the chief menace and gravest danger to the health of the rising generation, but likewise the crowning outrage upon the personal liberty of the American citizen.” —Dr. James Martin Peebles, MD, MA, PhD, “Vaccination a Curse and a Menace to Personal Liberty”, 1913
The USA, 1902. As vaccination spread across the Atlantic, the anti-vaccination movement also followed. In the US, it was headed by The Anti-Vaccination Society of America. In Canada, it was The Anti-Vaccination League. Prussia (part of modern day Germany) also had compulsory vaccination, and so did Austria, Japan, Philippines, and Switzerland. These countries (except for the Philippines) were among the first to undergo the Industrial Revolution, in which people congregated into cities and overcrowding was the norm. Children worked long hours in factories and fields. Factories had no ventilation and workers had to re-breathe dirty air.

The disease rates exploded for each successive year of compulsory vaccination. In other words, disease epidemics followed compulsory vaccination. Thus, every country eventually abandoned compulsory vaccination.
England, 1907. “About fifty Croydon fathers have gone to prison rather than have their children vaccinated or pay monetary penalties imposed.”

As Dr. Jennifer Craig, BSN, MA, PhD, summarized in her article, “Smallpox Vaccine, Origins of Vaccine Madness”:

“One of the worst smallpox epidemics took place in England between 1870 and 1872, nearly two decades after compulsory vaccination was introduced. Leicester, with nearly 200,000 inhabitants, boasted a 95% vaccination record but it suffered more deaths than less-vaccinated London. Faced with this obvious
evidence of the uselessness of vaccination, Leicester’s citizens rejected the program in favour of cleaning up the city. Under the leadership of James Briggs, Town Councillor and Sanitary Inspector, clean streets, clean markets and dairies, efficient garbage removal, sanitary housing and pure water supply replaced vaccination scars. In 1892-3 Leicester had 19.3 cases of smallpox per 10,000 population; similar-sized Warrington, with 99.2% vaccinated, had 123.3 cases.

“In Japan, in 1885, 13 years after compulsory vaccination, a law was passed requiring revaccination every seven years. From 1886-1892, a total of 25,474,370 revaccinations were recorded. Yet during this same period, Japan had 156,175 cases of smallpox with 38,979 deaths, a case mortality of nearly 25%. Slow learners, the government passed another act requiring every resident to be vaccinated and revaccinated every 5 years. Between 1889-1908, the case mortality was 30%. Prior to vaccination the case mortality was about 10%.

“During a ruthless campaign by the US in the Philippines in 1905, the native population were forcibly vaccinated several times. In 1918-1919, with over 95% of the population vaccinated, the worst epidemic the Philippines had ever known occurred. In the Congressional Record of December 21, 1937, William Howard Hay, MD, said, ‘The Philippines suffered the worst attack of smallpox, the worst epidemic three times over, that had ever occurred in the history of the islands and it was almost three times as fatal. The death rate ran as high as 60% in certain areas where formerly it had been 10-15%.”
Canada, 1919. STOP THE SLAUGHTER OF INNOCENTS. The anti-vaccination movement in 1919 (20th century), Toronto, Canada. In Canada, the main group was the Anti-Vaccination League. The Anti-Vaccination Society of America was the main group opposing mandatory (compulsory) vaccination in the USA. The society was founded in 1879.
The USA, early 2000s (21st century). Outspoken vaccination critics such as Jenny McCarthy, Dr. Andrew Wakefield, and other doctors and celebrities were blamed by the media for starting the anti-vaccination movement. As noted above, the movement has been around since 1853. Drug companies are one of the largest advertisers on TV, Internet, newspapers, and magazines. According to Robert F. Kennedy, Jr., the drug industry contributes up to 70% of advertising revenue to media companies. In 2017, the collective stock market capitalization of the drug companies (vaccine manufacturers) exceed $1 trillion. As actor Jim Carrey noted, “A trillion dollars buys a lot of expert opinions. Will it buy you?”

Mainly because of these movements, the public became aware of the dangers of vaccines. The lunatic idea of transferring animal diseases to humans to prevent diseases didn’t work. Compulsory vaccination was later repealed in every country because vaccines were found to be useless and poisonous. Several decades later, the drug companies began their mass advertising and marketing campaigns to “educate” the next generation on the benefits of vaccination.
Vaccination has been a menace to each generation since 1796.

**Disease Theories**
Most medical students are taught Louis Pasteur’s *Germ Theory of Disease*, which is partly true. We have little understanding of what germs are healthy or unhealthy for the body. We know that some germs do cause disease, in excessive amounts. However, it’s the unsanitary conditions of the environment and the unhygienic terrain of the body that create those germs—like rats are attracted to filthy places.
Germs do cause diseases, but more importantly it's the unsanitary environment and the unhygienic condition of the body that cause those germs. For example, if you don't want to get lung cancer, 1) Smoke and find a way to kill the cancer cells caused by smoking, 2) Don't smoke.

THE CELLULAR THEORY OF DISEASE (TREAT THE PERSON, NOT THE INFECTION).

“In 19th century France, while Pasteur was advocating the notion of germs as the cause of disease, another French scientist named Antoine Bechamp advocated a conflicting theory known as the ‘cellular theory’ of disease.

“Bechamp’s cellular theory is almost completely opposite to that of Pasteur’s. Bechamp noted that these germs that Pasteur was so terrified of were opportunistic in nature. They were everywhere and even existed inside of us in a symbiotic relationship. Bechamp noticed in his research that it was only when the tissue of the host became damaged or compromised that these germs began to manifest as a prevailing symptom (not cause) of disease.

“To prevent illness, Bechamp advocated not the killing of germs but the cultivation of health through diet, hygiene, and healthy lifestyle practices such as fresh air and exercise. The idea is that if the person has a strong immune system and good tissue quality (or “terrain” as Bechamp called it), the germs will not manifest in the person, and they will have good health. It is only when their health starts to decline (due to personal neglect and poor lifestyle choices) that they become victim to infections.” —www.MaroneWellness.com

Again, THE ONLY WAY TO PREVENT DISEASE IS TO REMOVE THE CAUSES. For example, smallpox was caused mostly by overcrowding, contaminated water, closeness to feces and urine, and food spoilage. Overcrowding has been solved by modern buildings and urban planning. Contaminated water was solved with sewer systems, plumbing, and water filtering systems. People no longer defecate or urinate in their backyards or buckets, thanks to toilets and indoor plumbing. Food spoilage was solved with electricity (refrigeration). Because of sanitation and hygiene, smallpox was eradicated in developed countries.
Louis Pasteur (1822-1895) was wrong, Antoine Bechamp (1816-1908) was right. Pasteur even admitted this in his dying days.

"Bernard was right, the germ is nothing—the milieu (the environment within) is everything." —Louis Pasteur

**VACCINATION IS NOT IMMUNIZATION**

Despite what the drug companies’ marketing machines claim, vaccination is NOT immunization. Immunization can only be attained when the immune system has encountered a natural infection and successfully fought it off. For example, those who had the natural measles are immune from it for life. Vaccine induced infections are vastly different than the wild infections. In infants, the antibodies required for immunization are passed from the mother’s breast milk. Vaccination destroys immunization.

There is a significant difference between theoretical science and observational science. With vaccines, observation contradicts theory. Vaccines work in controlled, sterile laboratory settings but not in the biological human body. The immune system exists for a reason. Nature is smarter than man. In vaccination, the most reliable source of observational science (data) is through the millions of parents who have vaccine injured children.

**THE GREAT HOMO SAPIENS**

The human body is the result of nearly 4 billion years of evolution, starting with the first prokaryotic cells (single-celled organism without a nucleus). Modern humans, Homo sapiens, as a distinct species have been around since 200 000 BCE. For the vast majority of that time, our ancestors had to struggle daily to obtain their physical needs: water, food, and shelter. They risked drinking contaminated water from streams, rivers, and lakes. They had to hunt and grow their own foods. Their nutritional profile was limited to what they were able to hunt and grow locally. They risked dying from exposure to the harsh weather.
For millions of years, humans and their common ancestors, struggled daily to obtain their physical needs: water, food, shelter. Since 1960 CE, those needs are effortlessly provided for us. The amount of energy expended to obtain our physical needs is minimal, allowing us with unprecedented leisure time.

In 1960 CE, those living in developed countries risk none of the dangers of obtaining their physical needs that their ancestors did. We simply walk to the sink and turn on the faucet to get drinking water. We drive to the supermarket, or even order online, to get a variety of foods around the world. We live in heated buildings with sanitation and hygiene safeguards as part of the building code.

In other words, as a distinct species, humans have had to struggle more than 99.999999% of their existence to obtain their physical needs: water, food, and shelter. In the 21st century, due to advances in technology, the energy required to acquire our physical needs has reduced dramatically, to the point that some are dying from sedentary lifestyles and not from securing their physical needs.

The great failure of vaccination is that it fails to addresses the underlying causes of diseases. It has been unequivocally demonstrated that when the causes of diseases are known and removed, those diseases can be prevented and eventually eradicated. Diseases have always thrived when our physical needs are unmet, or met in a way unnatural to the body. The body does not need the toxins in vaccines.

"As a retired physician, I can honestly say that unless you are in a serious
accident, your best chance of living to a ripe old age is to avoid doctors and hospitals and learn nutrition, herbal medicine and other forms of natural medicine unless you are fortunate enough to have a naturopathic physician available.

"Almost all drugs are toxic and are designed only to treat symptoms and not to cure anyone.

"Vaccines are highly dangerous, have never been adequately studied or proven to be effective, and have a poor risk/reward ratio.

"Most surgery is unnecessary and most textbooks of medicine are inaccurate and deceptive.

"Almost every disease is said to be idiopathic (without known cause) or genetic—although this is untrue.

"In short, our main stream medical system is hopelessly inept and/or corrupt. The treatment of cancer and degenerative diseases is a national scandal. The sooner you learn this, the better off you will be." –Dr. Allan Greenberg, MD, Dec. 24, 2002

January 2018
All fallacies classified as science must crumble before investigation. Such has been the fate of all the pretentious theories of earlier medicine, and such is the predestined end of the delusive hypotheses upon which are based many of the medical dogmas of today.

Of these dogmas I believe the practice known as vaccination to be most absurd, and most pernicious. I do not believe that a single person has ever been protected from smallpox by it; while I know that many serious bodily evils and even deaths have resulted from its employment.

Although I had often seen bad results following vaccination, like the majority of the profession, I never questioned the authority of the books regarding its prophylactic power against smallpox till my attention was specially directed to the subject, in 1872.

As severe epidemic of smallpox prevailed in New York, during that year, notwithstanding the fact that the health authorities had claimed the year previous, that the city was thoroughly protected by vaccination. The various medical societies appointed committees to enquire into the causes of the epidemic and why vaccination had failed to prevent it. I was appointed a member of such a committee from a medical society to which I belonged, and then, for the first time, I began a careful study of the subject of vaccination. I commenced with Jenner's own writings and carefully followed the history of the
subject as prepared by himself and his disciples, and before I got through I was forced to the conclusion that vaccination was the most stupendous fallacy that had ever been fostered by the medical profession. Since then, facts and figures have accumulated, in my hands, to such an extent as to compel me to abandon the practice of vaccination and to come out squarely in opposition to it.

In my knowledge of this subject prior to 1872, I do not think I was an exception to the majority of the profession. All our medical textbooks assert that vaccination is prophylactic against smallpox. In proof of this, they refer to the great ravages of the disease prior to the discovery of Jenner, and its decrease since that time. The professors in our medical colleges instruct the students in the same way, and when they, in turn, are asked for an opinion, the universal answer is, "certainly, vaccination is a sure preventive against smallpox." Few physicians attempt to investigate the subject further.

They have been taught to believe in vaccination, and it is unpardonable heresy to dispute its efficacy. Those who are opposed to it are denounced as ignorant, while in reality they are the only ones who are fully informed on the subject; and the time is not distant when the public will become so enlightened regarding this fallacy, that the vaccinator's lancet will be left to rust beside its twin monstrosity, the bloodletter's lancet.

Many believe in the value of vaccination because the medical profession generally recommend it. To such I would say, that twenty years ago the entire medical profession believed that bloodletting afforded the only relief in all kinds of fever, and that a drink of water given to a fever patient was certain death. A few reformers denounced this barbarous practice and some of them lived to see its complete overthrow, while the "leading minds in the profession" fought for it to the last. The leaders of the abolition movement in America were regarded as lunatics and some of them narrowly escaped death at the hands of the mob, but they lived to see their principles triumph and themselves honored by the whole civilized world. Thus it has ever been with every effort at reform—with every struggle of truth against error—and so it will be in this opposition of organized medical despotism to the enlightenment of the people regarding the monstrous and barbarous practice of vaccination.

Every intelligent person who takes the time to investigate this subject, will find abundant evidence in the published writings and public records of the advocates of vaccination, to prove its utter worthlessness, without reading a line of anti-
vaccination literature. And if we could add to this all the suppressed facts, we would have a mass of evidence before which no vaccinator would dare to hold up his head.

With the view of presenting the subject in its proper light we shall consider:

1) The History of Smallpox.

2) The History of Vaccination; and

3) The Evils of Vaccination.
CHAPTER 1

THE HISTORY OF SMALLPOX

There is a great diversity of opinion among medical writers regarding the antiquity of smallpox. Some assert that it was one of the plagues that so often devastated the oriental nations of antiquity. Others affirm that it prevailed in China and India, a thousand years before the Christian era, but that it was confined to very narrow limits, for centuries, till it finally spread into Europe, about the beginning of the eighth century. Certain it is, however, that we have no description of any disease having the characteristics of smallpox until the latter half of the sixth century, when it is described as breaking out in Arabia, A.D. 571—the year in which Mahomet was born. It was widely disseminated by the wars and expeditions of the Arabs, and is believed to have entered Europe at the time of the overthrow of the Gothic monarchy in Spain, by the Moors. Whatever its source or time of appearance it extended over Europe with fearful rapidity; and the loathsome character of its nature and the terrible havoc it attending it, filled the minds of the people with the greatest dread.

It is characteristically a contagious disease, and cannot be communicated except by actual contact with the person or the effluvia arising from the excretions of the afflicted, or with the clothing impregnated with the virus from the pustules. This fact was early recognized; and its spread into different countries was always supposed to be traceable to direct importation. On this point Sir Thomas Watson, in his Practice, says:

"While almost all men are prone to take the disorder, large portions of the world have remained for centuries entirely exempt from it, until at length it was imported; and that then it infallibly diffused and established itself in those parts."

Smallpox was unknown in the New World before the discovery by Columbus; but it was carried into St. Domingo in 1517. Three years later a negro, covered with pustules, was landed on the Mexican coast, and from him the disease spread so that in a short time, it is said, three millions and a half of people perished from it in Mexico alone. The absurdity of this claim of the vaccinators is too apparent to demand any attempt at contradiction. The population of Mexico in 1876, was 10,000,000. It certainly could not have been 3,000,000 in all, in 1520;
and even so, what means could have been employed at that time, to ascertain the number of deaths from smallpox. The disease was carried to Iceland in 1707, and to Greenland in 1733. Wherever it went devastation followed in its train; and so great was the popular dread that the people were willing to adopt any means that offered the slightest immunity against its ravages.

An examination of the statistics of smallpox proves that its greatest ravages occurred at the time when the commercial communications of the various nations began to be more general, and that the first ravages of the disease were greater than any subsequent ones. It would appear as an epidemic in various quarters of the globe and at various times, but it rarely proved as fatal as the first visitation. This was, no doubt, due to the fact that fear kept people from exposing themselves, and led to the practice of isolating the victims during the entire continuance of the disease.

As early as 1713, an English physician who had settled in Constantinople, wrote to a practitioner in London, concerning a new process, which was claimed to be successfully employed as a preventive against the ravages of smallpox. This process consisted in taking the virus of the smallpox and introducing it into a slight puncture in the skin, thus producing the disease, it was claimed, in a milder form. This practice was called inoculation, and was introduced into England by Lady Mary Wortley Montagu, wife of the British Ambassador at the Ottoman Court. She had her own children inoculated, and was so zealous in her work, that by the middle of the century, (1750) the practice had been extensively adopted in England, and had spread to various countries of Europe, and even to America. Its advocates claimed that the ravages of smallpox were thus greatly diminished, and the profession and public, alike, worked zealously to promulgate the practice. After vaccination was introduced, it was ascertained that inoculation added greatly to the number of smallpox cases, and that the mortality was not diminished, but rather increased. Stringent laws were then passed, in different countries, making the practice of inoculation a crime.
CHAPTER 2

THE HISTORY OF VACCINATION

In 1798, Edward Jenner, of Gloucestershire, England, called public attention to his discovery, that the virus of cowpox introduced into the human body, was a prophylactic against smallpox. His attention had been directed to the subject several years previous, by hearing a milkmaid say that she could not take smallpox because she had had cowpox. On examination, he ascertained that cows were often affected with a pustular eruption on the udder, and that the persons milking them were frequently affected by similar eruptions on their hands; and the popular belief was, that persons thus affected were not susceptible to smallpox. He soon began to experiment, by inoculating persons with the lymph from the cowpox pustules, and as these persons did not have smallpox afterward, he thought he had proved the truth of the popular belief in the prophylactic power of the cowpox.

In order to convince those who doubted the value of this pretended discovery, he experimented, by inoculating with smallpox virus, those he had previously inoculated with cowpox virus. Some of the persons thus experimented on did not have the smallpox, but unfortunately for his discovery, others fell victims to his experiments. He then discovered that there were two kinds of eruptions met with on the udder of the cow, one of which was spurious cowpox, and not protective against smallpox. The spurious was a spontaneous eruption, peculiar to the cow, while the genuine was produced by contagion from the grease in the horse. This grease, passing through the cow, and then inoculated into the human body, Jenner declared, as early as 1798, to be a preventive of smallpox "for life." This is Jenner's wonderful discovery, which has since been known as vaccination.

On this subject, Jenner writes, as follows:

"In this dairy country, (Gloucestershire) a great number of cows is kept, and the office of milking is performed, indiscriminately, by men and maid servants. One of the former having applied dressings to the heels of a horse affected with the grease, incautiously milked the cows, with some particles of the infectious matter adhering to his fingers. The disease thus communicated to the cows, and from the cows to the dairymaids, spread through the farm until most of the
domestics and the cattle feel its unpleasant consequences. This disease has obtained the name of cowpox."

In describing the disorder thus contracted, he further says:

"Inflamed spots begin to appear on the hands, sometimes on the wrists, which quickly rim on to suppuration. Absorption takes place and tumors appear in each axilla. The system becomes affected, the pulse is quickened, and shivering, with general lassitude, and pains about the loins and limbs, with vomiting, come on. The head is painful and the patient is every now and the unaffected with delirium. These symptoms generally continue from one day to three or four, leaving ulcerated sores about the hands, which commonly heal slowly, frequently becoming phagedenic, like those from whence they sprung. The lips, eyelids, nostrils, and other parts of the body are sometimes affected with sores. No eruptions on the skin have followed the decline of the feverish symptoms in any instance that has come under my inspection, one only excepted. Thus the disease makes its progress from the horse to the nipple of the cow, and from the cow to the human subject. What renders the cowpox virus so extremely singular is, that the person who has thus been affected is for ever after secure from the infection of the smallpox."

Of the pustular sores that appear spontaneously on the nipples of cows, he says:

"This disease is not to be considered as similar in any respect to that of which I am treating, as it is incapable of producing any specific effect on the human constitution."

Both of these points are reiterated again and again in his writings, so there can be no misunderstanding the source from which he derived his virus for what he called effective vaccination.

After he had settled this point satisfactorily to himself, reports came to him that even persons affected with the true cowpox had not been protected from smallpox. He then made the assertion, that it was only in a certain state of the pustule that virus was afforded capable of imparting to the constitution its protecting power; and that matter, taken after this period, might excite a local disease, but not of such a sort as to render the individual proof against the effects of variolus contagion. Then, he pretended, that if kept a few days, the virus underwent decomposition, and was thus rendered incapable of affording
protection against smallpox. Thus, as the Arabian prophet had new revelations to meet every unexpected exigency, so Jenner advanced a new theory every time that vaccination was shown to be a failure.

For a time Jenner's discovery was bitterly opposed by the profession; and even some of those who adopted it, claimed that inoculation directly from the grease of the horse, into the human body, was as protective as that which passed through the cow. Then came the claim that the virus taken from the person inoculated with the cowpox could be used to protect other persons; and, as the symptoms thus produced were less severe than direct inoculation from the cow, this method of vaccination soon became the prevailing one. At first, however, it was considered necessary to have recourse to the cow for a fresh supply of virus, every few years; but even this was soon regarded as unnecessary, and so the practice of vaccination from arm to arm was almost universally relied upon as a preventive of smallpox, for half a century.

From England, vaccination was introduced into the various countries of Europe, crossed the Atlantic to America, and even found its way to the jungles of Asia and to the barbarous tribes of Africa.

The movement took hold of the popular mind, and the medical profession accepted it on the same principle that they discontinued bloodletting. Then compulsory vaccination laws were passed in many of the countries of Europe—and the practice has come down to us as "the grandest discovery of modern times."

At first, all agreed with Jenner, that one vaccination protected a person for life, against smallpox; this, however, was soon found to be untrue. Then, one thorough vaccination in infancy and one after puberty, were deemed necessary. This also proved a delusion. Its advocates next advised the practice to be repeated at maturity. Then it was thought necessary that it should be repeated every seven years; and now, to insure perfect immunity, it is claimed, that every one should be vaccinated every two or three years.

This is the position occupied by most of the profession at the present day, although even here there is a marked difference of opinion among the so-called best authorities.

In the London Lancet of March 24, 1877, the editor writes as follows:
"After successful vaccination in infancy, revaccination is needed only once. The second operation should, if practicable, be performed at the age of puberty, or, there being immediate danger of smallpox, at the age of twelve. Revaccination at an earlier age is futile. Repeated revaccinations are foolish. Revaccination, when successful is needed once only."

As the question now stands, it is impossible to ascertain what constitutes effective vaccination. In every country where it is practiced, the profession are divided respecting the merits of humanized and bovine virus. One party claims that vaccination from arm to arm is more certain, while it can do no harm. The other contends that it does not protect, and that numerous diseases are communicated thereby, while they claim that the bovine virus is certain and harmless. The bovine virus, that is thus advocated, has been obtained by inoculation from the spontaneous cowpox, and Jenner declared that this would not protect against smallpox.

Again, some have advocated the inoculation of a cow with smallpox virus, to obtain a supply of vaccine virus, while others claim that this only spreads the smallpox.

The truth is, that no two physicians agree as to what constitutes effective vaccination. Some still agree with Jenner, that one vaccination is sufficient; others take sides with the Lancet, and believe that only one revaccination is necessary. Some say we must vaccinate every seven years, while others still, affirm that we must be vaccinated every two or three years to be perfectly protected against smallpox.

Whatever way we look at the question, it is certain that none of the methods now employed correspond with the discovery of Jenner; and the time is not far distant, when all will be rejected.

Had Jenner been a conscientious searcher after truth, he never would have asserted, six years after he commenced his investigations, that the vaccine disease "for ever after secured against the infection of smallpox." Had he been a real scientist he would never have invented new theories to account for every failure in the results of his investigations, at least, till a sufficient number of years had elapsed to prove the general truth of his assertion. Had he discovered any actual scientific truth, it would have come down to us precisely as he gave it to the public in 1798.
Physiology teaches us that all poisons are either eliminated from the body, or so interfere with the functions and tissues as to produce disease or death. When zymatic poisons, such as those of smallpox, scarlet fever, measles, etc., are introduced into the system, the normal functions are interfered with and thus we have a condition that is called disease. A conflict goes on between the vital forces and the poison, and one or the other must succumb. If the vitality of the patient is sufficiently strong, or in other words, if the patient is healthy and robust, the poison is eliminated, and the body is left with its component parts in the same conditions as before its introduction. If, on the other hand, there is not sufficient vitality, the poison gains the ascendancy and the patient dies. Poisons such as syphilitic may remain in the system for a long time, but when they do, they manifest themselves by abnormal conditions of the various tissues, which result from the efforts of nature to throw off the morbid influence.

Persons who are exposed to the contagion of smallpox, when in a debilitated condition are liable to take the disease, while those who are strong and robust may escape entirely, have it lightly; and the same is true of ah other diseases. "When a specific virus is introduced into the body by inoculation, it is more apt to affect the system; but even here some escape infection altogether, others are slightly affected, while some suffer severely in consequence. Those who cover throw off the poison entirely, and may be similarly affected at any time afterwards, provided they are exposed to the infection while in a debilitated condition. This fact has been so often demonstrated by persons having scarlet fever, measles, cholera, diphtheria and smallpox, two and three times, that its truth cannot be questioned. Now what is true of these diseases must also be true of the vaccine disease, and it is for the same reason that vaccination may be repeatedly performed on the same person, and be found to take each time. Then I ask, is it reasonable to suppose that vaccination can protect against smallpox, when it cannot protect against itself, and when one attack of smallpox cannot protect against another.

The very first person Jenner vaccinated and pronounced safe "for life" against smallpox, afterwards took the disease and died from it, and ever since that, the history of the subject proves that such results are so frequent, that the value of vaccination as a prophylactic against smallpox is completely disproved.

But we are told, that vaccination has arrested the fearful ravages of smallpox, and reduced its mortality to almost nothing. We have been told over and over
again that smallpox had been stamped out in different localities, by efficient vaccination; and after it had again appeared the cry came, "the people are not half vaccinated."

Now what is the truth of this matter? It is simply this that the first visitations of all epidemics are more fatal than subsequent ones.

The plagues that formerly devastated the Eastern world were less and less severe with each visitation, till now they have entirely disappeared. Those that swept over Europe up to the beginning of the eighteenth century also became less fatal with each return, till now they are unknown. Cholera, which, at one time, carried panic and death to almost every door, can now hardly gain a foothold in any civilized country. And smallpox, too, had gradually become less prevalent, and less fatal, till in Jenner's time it appeared in a very mild form and attended with but little mortality. To what can we attribute the decline of these diseases? I suppose, had Jenner pretended that vaccination was prophylactic against all, it would be so asserted today; but this change occurred in some of them before Jenner's time, and he cannot even claim the diminution of smallpox as depending on a discovery that had not then been promulgated. No! The only pretense that can be advanced to account for this decreased mortality, is that civilization brought knowledge of hygienic and quarantine advantages; and as these measures were adopted the diseases declined.

In 1864, a report was published in England, in which tables were compiled to prove the value of vaccination. They commenced with the year 1838, which was before the compulsory vaccination laws were passed, and ended in 1861. The unfairness of their figures becomes apparent when it is known that smallpox prevailed more in 1838 than any time during the century, and then no returns are given for the years 1843-44-45-46, because epidemics prevailed and the deaths had increased in those years. The following is a summary of the table:

For the years 1838, 1839 and 1840, before the compulsory vaccination act was passed, the annual average death rate was claimed to be 11,944. From 1841 to 1853, vaccination was provided gratuitously but was not obligatory, and the average annual death rate was 5,221, not including the epidemics of 1843 to 1846, which are omitted from the reports.

From 1854 to '61, inclusive, vaccination was obligatory, and the annual average death rate was 3,240. Here they stopped and claimed for vaccination the
difference in the annual death rate, between 11,944, and 3,240.

In the last year included in their table the number of deaths was 1,320.

In 1862, which is omitted from the table, it was 1,628;

-in 1863, 5,964;
-in 1864, 7,684;
-and in 1865, 6,411;
-and again in 1871, the deaths were 7,876 in London alone.

Now if vaccination reduced the death rate from 16,268 in 1838, to 1,320 in 1861, what increased the death rate so much in the four succeeding years, and in 1871?

The facts in regard to the stamping out of smallpox in England, as reported by the Registrar General, are summarized as follows:

Vaccination was made compulsory by act of Parliament in the year 1853; again in 1867, and still more stringent in 1871. Since 1853, we have had three epidemics of smallpox, each being more severe than the one preceding.

Deaths from smallpox in the first ten years after the enforcement of vaccination, 1854 to 1863..................33,515
In the second ten years, 1864 to 1873.......70,458

The Registrar General in his *Annual Summary* for the year 1880, tabulates the smallpox mortality of London for the last forty years as follows:

| Decades  | Estimated Mean Population | Smallpox Deaths |
|----------|---------------------------|-----------------
| 1841-50  | 2,103,487                 | 8,416           |
| 1851-60  | 2,270,489                 | 7,150           |
| 1861-70  | 3,018,193                 | 8,347           |
| 1871-80  | 3,466,486                 | 15,543          |

In addition to these facts, the same returns show that for the year ending December 31, 1881, 2,371 persons died in London of smallpox.

Again, a careful examination of all returns of smallpox shows that the highest mortality in any one year, in London, in the last century, was 3,992; while the total deaths from this disease during the first twenty years of the present century, was 20,462, or an annual average of 1,023, when neither inoculation or vaccination was practiced to any extent. From the passage of the registration act in 1838, to 1853, when the Compulsory Vaccination Act was passed, the official returns of the Registrar General show the total number of smallpox deaths to be 10,521, which makes an annual average of 1,032. For the 24 years of compulsory vaccination ending with 1877, the annual average death rate was 1,092. Again, for the decade ending with 1880, and with 93% of the population protected by vaccination, the average annual death rate increased to 1,554; while during the year 1881, it was further increased to 2,371.

In Sweden from 1775 to 1792, without vaccination the deaths from smallpox per million inhabitants ranged from 300 to 900 per year. From 1802 to 1810, with from two to forty persons in every thousand vaccinated, the deaths per million inhabitants per year, were successively, 600; 600; 600; 450; 600; 850; 750; 1,000; 300.

The following table shows the ratio of the subsequent years:
<table>
<thead>
<tr>
<th>Year</th>
<th>Vaccinated per 1,000 Inhabitants</th>
<th>Deaths per Million Inhabitants</th>
</tr>
</thead>
<tbody>
<tr>
<td>1825</td>
<td>250</td>
<td>400</td>
</tr>
<tr>
<td>1839</td>
<td>590</td>
<td>575</td>

<td>1851</td>
<td>735</td>
<td>700</td>
</tr>
<tr>
<td>1874</td>
<td>970</td>
<td>960</td>
</tr>
</tbody>
</table>

In the face of these figures, is it not absurd to claim that vaccination has stamped out smallpox in England and Sweden.

The same result is demonstrated by the official returns of Prussia, as shown in the following table:

<table>
<thead>
<tr>
<th>Year</th>
<th>No. of Persons Unvaccinated in every 100,000</th>
<th>Deaths from Smallpox to every 100,000 inhabitants</th>

In the great smallpox epidemic of 1870-72, at Cologne, 2,400 persons took the disease, of which 2,351 were vaccinated and the majority revaccinated, while only 49 were unvaccinated. At that time the population of Cologne was 125,000, of which 8,000 were unvaccinated. This gave one case of smallpox to 53 vaccinated persons, while there was only one case to every 161 of the unvaccinated.

Valuable statistics have also been collected from hospital reports, which further demonstrate the fallacy of vaccination. From 1700 to 1779, there were collected from hospital reports, 24,994 cases of smallpox, of which 4,707, or 18.83% died. From 1836 to 1880, of 48,248 hospital cases, 8,926, or 18.5% died. Of the first, none were vaccinated, while of the latter, 34,423 were reported as protected by vaccination.
VACCINATORS FALSIFY STATISTICS

The statistics above quoted are at variance with many of those presented by the advocates of vaccination, who have persistently kept up a system of falsification and misrepresentation, to bolster up their crumbling fallacy.

The National Vaccine Establishment of England, was created by Act of Parliament in 1808. The Board of Managers of this establishment in their report for 1811, wrote as follows:

"Previous to the discovery of vaccination, the average number of deaths by smallpox within the London bills of mortality was 2,000 annually; whereas during 1811, only 751 died of the disease," etc.

In 1818 this Board again says:

"Instead of 2,000 deaths by smallpox, which was the annual average previous to the practice of vaccination, there died in 1818, only 421."

In 1826 we find in the report of this same Board these words:

"But when we reflect that before the introduction of vaccination the average number of deaths from smallpox was annually about 4,000, no stronger argument can reasonably be demanded in favor of the value of this important discovery."

Again, in 1836, the paid officials of this vaccine establishment, encouraged by the fact that their report of 1826 had not been questioned, still further falsify facts by the following report:

"The annual loss of life by smallpox in the metropolis before vaccination was established, exceeded 5,000."

Contrast with these statements the official report of Dr. Farr, and we have a fair illustration of the manner in which vaccination statistics are manipulated in England, and in every other country, where the paid advocates of vaccination and the producers of the virus feel called upon to keep up the popular delusion concerning the prophylactic value of vaccination.
Dr. Farr states the facts in these words:

"Smallpox attained its maximum mortality after inoculation was introduced. The annual deaths from smallpox in London, from 1760 to 1779, were on an average 2,323. In the next twenty years, 1780 to 1799, they declined to 1,740. The disease, therefore, began to grow less fatal before vaccination was discovered, indicating, together with the diminution of fevers, the general improvement of health then taking place."

These are facts that cannot be gain said, and they irrefutably disprove the assertion that 40,000 died annually in England, before the introduction of vaccination, which is the claim made by vaccinators to prove the value of their vaunted prophylactic.

In the reports of smallpox hospitals, a number of cases are always reported as unvaccinated; and in the fatal confluent cases, where vaccination marks could not possibly be seen, and where no inquiry has been made regarding previous protection, they are invariably returned as unvaccinated. I have personal knowledge of several such cases in New York, during the past winter.

An expose of this kind was made in 1875, by Mr. John Pickering, of Leeds, England. The Leeds' smallpox hospital had reported 715 cases treated, from January 29, 1872, to October 24, 1875, of which they reported 600 vaccinated and 115 not vaccinated. Mr. Pickering and his friend Mr. Kenworthy, investigated about half of this number, and though they could find no trace of many of the patients, they ascertained the following facts six living witnesses were entered "unvaccinated," all of whom had been vaccinated; nine deceased persons were entered "unvaccinated," all of whom had been vaccinated; eight cases entered as "unvaccinated," should have been entered unsuccessfully vaccinated; four cases were entered "unvaccinated," which should have been returned "certified unfit."

Proofs of these facts were presented to the Leeds' Board of Guardians, with the offer to continue the inquiry over the other cases, but an investigation was refused.

This is but another sample of the manner in which statistics in support of vaccination are manufactured, but such figures cannot deceive any one who is
earnestly endeavoring to ascertain the truth concerning this important question.

VACCINATION IN AMERICA

In quoting statistics on smallpox and vaccination, we obliged to use those of foreign countries, for the reason that none are accessible in America. Even the Boards of Health of our large cities make no effort to ascertain whether those attacked with smallpox have been vaccinated.

In New York and Brooklyn, repeated endeavors have been made to stamp out smallpox by thorough and systematic vaccination. It has been made compulsory in our schools, and during the past ten years, revaccination has been demanded, or in its place a certificate from a physician that revaccination was unnecessary. Vaccinators have gone from house to house, to vaccinate old and young, and it is claimed by the Health Board of New York, that they have vaccinated 800,000 persons during the past eight years.

The profession generally have enjoined the people to have recourse to repeated revaccination, and with 3,000 physicians in private practice in New York, it is certain that the entire population, with very few exceptions have been vaccinated from one to six times. Yet smallpox prevails, and this protected people are as much in dread of the disease as if they had never been vaccinated.

For the past ten years I have rarely met persons marked with smallpox, without asking them if they had been vaccinated; and in almost every case I received an answer in the affirmative, while many knew of a number of cases of deaths from smallpox, among friends who had been vaccinated and revaccinated. During the past year I have known of several cases of smallpox in persons who had been revaccinated and pronounced thoroughly protected by the public vaccinators, notwithstanding the declaration of Dr. Taylor, the chief of the Vaccination Bureau, that "Vaccination is an absolute protective against variola."

In 1872 and 1873, I corresponded with over two hundred medical men, and questioned them on the value of vaccination in their experience. The aggregate number of smallpox cases seen by these physicians was 6,423; of which 4,020 had been vaccinated, and 3,008 of these revaccinated. In my own practice, I have seen 20 cases of smallpox, of which fifteen had been vaccinated, and eleven of
these revaccinated. Of my own cases, four died, three of whom had been vaccinated, and one of the three revaccinated, while the fourth was that of a child who had not been vaccinated on account of poor health.

**THE VACCINATORS’ CHANGE OF BASE**

After the advocates of vaccination were forced to abandon the claim that it protected for life against smallpox, they declared that when vaccinated persons did take the disease, it was only in a mild form. This was disproved, even in Jenner's time, by the death, from smallpox, of persons who had been vaccinated, and such cases have multiplied to such an extent with every epidemic, that another change of base was found necessary.

Revaccination every few years was then advocated as a certain means of mitigating the severity of smallpox, and still deaths occurred.

It is now the custom to claim that every person who escapes smallpox, whether vaccinated once or a dozen times has been protected by the vaccination; while it is asserted that the vaccination was not properly performed, in all cases where smallpox does occur. In other words, they claim that we are protected till the breaking out of the disease proves the contrary, and then they assert that we had no proper protection.

gain, every mild case is pronounced varioloid, if found among the vaccinated, and variola, if seen in the unvaccinated. This claim is entirely without foundation in fact, as it is well known that all diseases attack persons with different degrees of severity, the strong and robust being slightly affected, while the weakly suffer severely. One child is very sick with measles, while another in the same family may have the disease so slightly as not to affect it in the least; one may die from scarlet fever, while another may only be slightly indisposed for a few days; one may have the whooping cough for a week or two, while another may suffer from it for months.

One person may die from cholera in a few hours, while another may have it severely, and yet recover; and one may feel slightly indisposed from malarial influences, while another may be a great sufferer for months, from the same cause. This being true, is it reasonable to suppose that smallpox should be an
exception to the general rule, and only those who have been vaccinated, have it lightly’? Certainly not; the facts prove that it is the weakly who die from smallpox, whether they have been vaccinated or not. And, besides, it is the rule not to vaccinate delicate, sickly children, and when such take smallpox they are more liable to die, and the want of vaccination is assigned as the sole cause of the disease.

THE PROPHYLAXIS OF VACCINATION HAS NEVER BEEN TESTED

Notwithstanding all that has been claimed in favor of vaccination, I contend that its prophylaxis against smallpox has never been tested. Ever since its introduction, the most rigid quarantine regulations have been enforced in all smallpox cases, and from the very nature of the disease, it must be admitted that such measures, of themselves, are calculated to prevent its spread, while superior knowledge enables physicians to treat it more successfully than formerly.

In all large cities, contagious diseases, including smallpox, prevail most extensively and fatally in the low-lying, badly drained and ventilated, filthy and densely populated districts, where contagion cannot be prevented; and in these districts, too, vaccination has been almost universally performed, because it has been enforced and done without charge.

If vaccination and revaccination will certainly prevent smallpox, why do its advocates insist on the enforcement of quarantine regulations? Why do they exclude unvaccinated children from our public schools? Why are those who have been protected by repeated vaccinations so panic stricken when a case of smallpox is discovered in their midst? Certainly these facts prove that they have no faith in their vaunted prophylactic. The whole history of the way vaccination protects against smallpox is summed up in the action of the New York Health Board, as illustrated by their management during the past winter.

A case of suspected smallpox is reported, and an inspector is sent to examine the patient. The diagnosis is confirmed and the patient is removed before vesication takes place, which is before the period of contagion. The house is then thoroughly fumigated, antiseptics are used in every direction, and then all the inmates are thoroughly vaccinated. If no other cases occur, the credit is given
entirely to the protective influence of the vaccination; while the removal of the patient before he could possibly communicate the disease, and the hygienic measures employed, are never mentioned.

If vaccination is the vaunted protective it is claimed to be, why not depend on it alone? Why not prove by actual facts that the vaccinated are safe from smallpox under all circumstances, while the unvaccinated are certain to take the disease whenever exposed to it? This cannot be done, but on the contrary thousands have lost faith in vaccination because of its repeated failures.

All the protection we have against smallpox comes from our improved knowledge of the hygiene of the person, the home, and the community; and if 1/4 of the money that is now spent to support a vaccination aristocracy was applied to improving the conditions of life in localities where smallpox usually originates, we would not only banish smallpox, but with it all other zymotic diseases. I contend that vaccination, without quarantine and hygienic conditions, would show an enormous increase of smallpox in a very short time, while the strict observance of the latter, without vaccination, would tend to improve the general physical condition of our people and this further diminish the fatality of smallpox.

Until the advocates of vaccination are willing to depend on their own prophylactic, they should cease to urge it upon those who have no faith in it.
CHAPTER 3

THE EVILS OF VACCINATION

Even if there was any evidence to prove that vaccination was a prophylactic against smallpox, the appalling evils that have been and are still produced by it are sufficient to condemn the practice as a crime.

Every physician of experience has met with numerous cases of cutaneous eruptions, erysipelas, and syphilis, which were directly traceable to vaccination, and if these could all be collected and presented in one report, they would form a more terrible picture than the worst that has ever been drawn to portray the horrors of smallpox.

In 1872, I condensed into a report, the following summary of evidence (under oath), taken by a committee of the British House of Commons, in 1871, on this subject. It speaks for itself:

Dr. Collins testifies:

"After twenty years experience as a vaccinator, during six or seven smallpox epidemics, I have ceased to vaccinate ten or twelve years; and gave up at least £500 sterling a year by so doing. I consider vaccination not only useless, but an evil. Have often seen children with syphilitic eruptions, after vaccination, whose parents were free from any taint. Have seen children, hitherto healthy with no trace of struma, after vaccination assume a scrofulous character, with every characteristic of a strumous habit. Erysipelas and phlegmanous ulcers are also by no means uncommon after vaccination. In a particular case I vaccinated an apparently healthy child with lymph from the national vaccine establishment, and on the eighth day, from a true Jennerian vesicle on its arm, I, at the request of the parents, friends of the first, vaccinated another healthy child; and three weeks after both children were brought to me, having decided syphilitic symptoms; when, on examination, it was found that the father of the first child had constitutional syphilis. The parents of the second child were perfectly healthy, but the syphilis had been conveyed to it by the vaccine lymph taken from the other. Was once consulted by some young ladies who had been vaccinated from their brother, who had been suckled by a syphilitic nurse, and,
on being discovered, it was found that her own child had the usual syphilitic symptoms."

Dr. Pearce testifies:

"I have given special attention to the subject of vaccination for 18 years. Returns show a large increase of consumption. I knew a lady and her elder brother, unvaccinated, the only survivors of 10 children, the rest having been vaccinated, 5 of whom died in childhood, and the remaining 3 at from 15 to 18, of consumption. The mother always attributed the death of her 8 children to vaccination. The ancestors on both sides for generations were all healthy country people. There was no defect of nutrition, no re-breathed air of workshops.

“When vaccinating, as I formerly did extensively, I was astonished to find that I had unwittingly transmitted syphilis from lymph supplied by the Jennerian Institution; I had proved that no taint existed in the parents; had 20 or 24 such cases within four years at Northampton."

Referring to the 540 practitioners who are reported to have taken grounds against his positions, he says:

"They are chiefly surgeons of hospitals, who perhaps have never vaccinated or been in general practice; the answers of such men are of no value. Mr. Whitehead, of Manchester, reports several instances of syphilitic taint, transmitted from a true Jennerian vesicle. This is positive evidence; but men may say that they never have seen what they never had an opportunity of seeing. Dr. Ballard had stated that a true Jennerian vesicle cannot be distinguished from a vesicle containing syphilis."

Dr. J. J. Garth Wilkinson testifies:

"I have vaccinated to within the last five years without thinking about it. Vaccination is so entirely secundem artem, the large majority cannot think about it. We are continually coming upon venerable fallacies; but on this question prestige and interest prevent investigation. Six positive cases are worth 10,000 negatives, which go for nothing."

Dr. Silljestrom, a man of great scientific eminence, and a legislator in Sweden, says:
"I have always felt that if vaccination does not stand against smallpox it is nil; if it does so stand, millions to one but what it imparts other and more powerful disorders into the system. My own coachman's child took erysipelas concurrently with vaccination, and both the child and its mother, who was nursing it, who had had smallpox, died of the erysipelas. Knew a case of an eminent literary man crippled with a skin affection, a kind of eczema of the leg, ever since being revaccinated four years since. Have often, almost daily, heard parents say, "My children have never been the same since they were vaccinated."

Dr. G. S. Gibson testifies:

"I attribute the large increase in infant mortality to their being poisoned in the first year of life, in a greater proportion than formerly, by vaccination. Constitutional diseases may be perpetuated in the same way, and the foundation laid for tubercular disease of some kind."

Prof. Ricord says in a French Medical Journal, of March 10th, 1865:

"At first I repulsed the idea that syphilis could be transmitted by vaccination, but today I hesitate no more to proclaim the reality."

Mr. Emery testifies:

"I have seen much suffering, ulcerous sores, etc., from vaccination. Vaccination is matter taken from the cow, put into the arm, and from arm to arm, for thirty years, and all manner of dirt is scraped out of one person's arm and put into another. I had a healthy child, eleven weeks old, vaccinated in May, 1869. On the ninth day it became very ill, the arm, body, and legs swollen, and turned red and green, having no rest night or day till its death, a month after. Have since seen one hundred to one hundred and fifty healthy children suffering, immediately, after vaccination, and parents who have lost their children by it."

Mr. Covington mentions the case of a healthy child, twelve months old, in whom syphilitic appearances showed themselves five weeks after vaccination. His own child was taken ill immediately after vaccination, and suffered for nine months, and afterwards from abscesses, etc., for four years. In a third case, a child of four months, immediately broke out with sores, and died in the tenth month. Believes vaccination conveys consumption, syphilis, and many other like
Mr. Adison deposes:

"That on the 8th day of September, 1870, he had a sound, healthy child, three months old, vaccinated against his will, to obey laws; three days after it broke out in a fearful rash, which continued to increase for eight weeks, when it died."

Rev. Hume Rothery testifies:

"I had a healthy child which suffered from a long series of very large boils, coming on three months after vaccination, which I believe to be the cause. Another case, a healthy child, nine months old when vaccinated, was afterwards afflicted with sore eyes for many years, and they are still weak; it being afterwards found that sore eyes prevailed in the family from which she was vaccinated.

“A third case, a fortnight after vaccination, (at nine months old) became covered with an offensive eruption all over the body, is now three years old, and has seldom since been free from sores and scabs; her elder brother, not vaccinated, father and mother, and families are remarkably healthy.

“A fourth case, now four years old, healthy before vaccination, has never since been so; nine months afterwards foul sores broke out, which continued, and appear likely to continue; there is a hole in one hand, and the foot probably crippled for life.

“In a fifth case, vaccinated when a babe, the family all perfectly healthy, cancer appeared on the chin, at eighteen months old, and she lost the left breast from cancer at thirteen.

“A sixth case, exceedingly well before vaccination, was never well afterward. Its flesh rotted on slightest scratch of a pin, and now and then broke out in in scales and sores; it died when twenty months old. Six other children were vaccinated from this child, not one of whom survived.

“A seventh case, a healthy baby before vaccination, became ever after an indescribable sufferer, and died at nearly eight, his body being literally rotten; father, mother, and five other children all remarkably healthy.
“In an eighth case, a healthy boy, four months old, was vaccinated; three months afterwards the arm began to break out, the head was one mass of sores, which continued for twelve months; believe it was syphilis; there had never been any disease in parents' families. Could mention a considerable number of other cases, eight—all of deaths—from Rochdale; twelve from Smallbridge, many others from Scotland; all attested before magistrates, with the understanding that they were to be laid before this committee. Could mention a number of other cases, but the sufferers are afraid to come forward. A child may appear healthy, but no one can say where a latent taint exists."

Dr. Nicholson, a pro-vaccinator, writes:

"If a case can be made out against vaccination, by all means let the law be repealed."

Whilst Dr. Blanc, also a vaccinator, says:

"Persons who deny such transmission are greater foes to vaccination than its declared adversaries."

Mr. Simon testifies:

"There is not the least doubt that syphilis has, on several occasions been communicated on the continent by what was purported to be vaccination. Lymph ought not to be taken from a subject who can be reasonably supposed syphilitic. A vaccinator should assume that such would convey syphilis. Practically, we should expect lymph taken from a syphilitic child would be syphilitic, as the safe side to err on, without attaching importance to negative experiments."

Dr. Bakewell testifies:

"There is a very strong opinion among medical men in the West Indies that leprosy has been communicated by vaccination. They often apply to me for lymph from England, though there would be an equal chance of English lymph being contaminated by syphilis; have seen several cases of leprosy where vaccination seemed to be the only explanation; have a case now, a child from India, a leper, both parents being English; saw another, a Creole of Trinidad, also of English parents Sir Ronald Martin agreed with me that the leprosy arose from
vaccination. Have seen several cases of leprosy resulting from vaccination, arrived at the conclusion with reluctance in the face of difficulties. Have no doubt death resulted from syphilis, produced by vaccination, in the Rivalta cases. There are two hundred and 48 such cases mentioned by Lancereaux as having occurred in France, Italy, and Germany. Think there are others of which we have no knowledge."

Mb. Hutchinson testifies:

"I was asked by the medical man to examine into the communication of syphilis to several adult servants and shopmen who were revaccinated, on the 7th of February last, from one child, lent to the operator from a public vaccinating station. Of thirteen so vaccinated whom I saw on the fourth or fifth of April, eleven had on their arms sores characteristic of syphilis—the primary sore of syphilitic contagion; the two who escaped were the first vaccinated. A few days later saw the child (six months old), from whom the lymph was taken, and though it appeared in good health, I should have no doubt it was the subject of inherited syphilis; it had an eruption on the body, then very slight indeed, and probably not present at the time of vaccination."

Dr. WM. Collins, of London, concludes an article on this subject, in these words:

"I am bound to admit that I have no faith in vaccination, nay, I look upon it with the greatest disgust, and firmly believe that it is often the medium of conveying many filthy and loathsome diseases from one child to another, and it is no protection from smallpox. Indeed, I consider we are now living in the Jennerian epoch for the slaughter of the innocent, and the unthinking portion of the population."

The Lancet of November 16, 1861, contained an account of the inoculation of 46 children with syphilis, conveyed by means of vaccination. And in 1866, thirteen children were similarly affected by vaccination from a child, who had been vaccinated with lymph obtained from the medical authorities. On the same subject the Lancet of January, 1866 says:

"This highly important subject has been fully treated by the Siglo Medica, a Spanish medical paper. In this article we find statistical tables of value. The author, in collecting data respecting instances of syphilitic contamination through the vaccine virus, shows that the disease was communicated in 224 out
of 314 vaccinations."

Volume twelve of the *Union Medicate*, a French magazine, contains a report of the celebrated Rivalta cases in Italy in 1861. In these cases 46 children were vaccinated with virus from an infant that seemed healthy, and seventeen were afterward vaccinated from one of the children of the first series, and of these 44 were affected with syphilis, and they in turn propagated the infection to their mothers and nurses. Dr. Henry Lee, a great authority in syphilis, stated after investigation, that he could come to no other conclusion but that the disease was communicated by vaccination in the Rivalta cases.

Prof. Joseph Jones, of Nashville, Tennessee, of the late Confederate army, published, in 1867, a pamphlet of 164 pages, in which he gives the sworn testimony of many prominent physicians in the Southern States, proving beyond doubt, that many hundreds of soldiers had died from syphilis and gangrene caused by vaccination.

At times when any number of vaccinations are being performed, hardly a week passes without reports of deaths from erysipelas following vaccination. In spite of the utmost care, I frequently met with such cases in my own practice, before I abandoned vaccination, and there are few physicians who have not similar experiences to record.

That erysipelas and infantile syphilis have increased to an alarming extent during the past twenty years, can be proved by the death returns of every country where vaccination is practiced, and the best authorities in the world no longer deny that both of these diseases have been largely augmented by vaccination.

Such cases are being reported from every part of the United States, and the individual testimony of physicians, in private practice, would fill many volumes without exhausting the horrors that have been developed by vaccination.

Vaccinators had long denied that disease of any kind could be communicated by vaccination, but by degrees, many in this country tacitly admitted their error, by substituting bovine for humanized virus.

It was positively declared by the Metropolitan Board of Health, of the City of New York, in 1872, that the humanized vaccine lymph had never conveyed diseases from one person to another. They were actually forced to abandon that
position in less than three years. A bureau was then established, in the department, for the purpose of supplying bovine virus, and all physicians in the city were notified that they should adopt it in their practice. They asserted that this virus was the genuine vaccine lymph, obtained in France from pustules spontaneously formed on the udders of cattle; and have since declared that they use no other. This claim had allayed the fears of the people about the dangers of vaccination, as it was thought no disease could follow the use of this bovine virus. Dr. Martin, of Boston, the New York Health Board, and a number of other enterprising doctors, are now engaged in producing this "virus," which Jenner claimed "did not protect against smallpox," and these are the men who mislead the public by false statistics and are urging the passage of compulsory vaccination laws. But they do more than this. They deceive the people in regard to the kind of virus they use and offer for sale.

At a recent meeting of the First Anti-Vaccination League of America, the writer stated that the officials of the Board of Health collected the scabs from the arms of children vaccinated by them, without regard to the health of the children, and sold them at two dollars a scab. A Herald reporter interviewed Dr. Taylor, chief of the Vaccination Bureau, and he was obliged to admit that such scabs were collected, but were not used at home. He then acknowledged that they were sold for use in Cuba and South America. Is not even this admission enough to stamp the men who claim to supply "only pure bovine virus," as unworthy of public confidence.

The public must not be mislead, however, by the claim, that no disease can be communicated by bovine virus. Domestic cattle are subject to all the diseases to which man is liable, with the possible exception of syphilis, and many careful observers have found those diseases in progress after vaccination. Erysipelas and various cutaneous eruptions are common sequences of bovine vaccination, and Dr. G. H. Merkell, of Boston, has reported cases having all the characteristics of syphilis, following the use of Dr. Martin's virus on children previously healthy, and in whose families no taint of disease could be traced.

On this subject The Lancet, (London), June 22, 1879 says:

"The notion that animal lymph would be free from chances of syphilitic contamination is so fallacious that we are surprised to see Dr. Martin, of Boston, Mass., U.S. reproduce it."
When vaccination of all kinds is entirely abandoned, and people are more thoroughly instructed regarding the laws of health all forms of zymotic diseases will be unknown, and the general vitality of the race will be greatly improved.

**WHO UPHOLDS VACCINATION?**

There are several classes of persons who uphold vaccination:

1) The vaccination rings, consisting of the officials of health boards, and public vaccinators, who are yearly receiving millions of dollars from the public treasuries. It is their interest to favor the practice at all hazards, and they falsify statistics in order to conceal its failures and evils.

2) Thousands of medical men believe in vaccination because they have been taught to do so, and because the best authorities recommended it. They have vaccinated because it was the custom and they were paid for it. They have supposed vaccination would prevent smallpox, and they never dreamed of making any investigation for themselves, or even giving it a moments thought.

3) A rapidly increasing number of the profession, who have no faith in vaccination, tell us that if people wish to be vaccinated they might as well do it and get the fee, as someone else would do so if they did not. The people believe in it and they encourage the belief.

Of the first class we have no desire to speak. They intentionally or ignorantly ignore all the facts of history and aim at making every thing conform to their ideas and wishes. Among the second class there are many sincere men who undertake to defend vaccination, but they cannot see both sides of the question; and with a few old figures and a rehash of the old story, they rush into print to convince the profession and the people of the great value of vaccination.

It is hard to abandon old theories and beliefs. It is harder still to uproot popular fallacies; but that vaccination is doomed to follow into oblivion, the practice of bloodletting, and general depletion, and the numerous other empirical practices that once constituted regular medicine, is as certain as that the sun shines.
THE OPPONENTS OF VACCINATION

Those whose interest it is to keep up the belief in the prophylactic value of vaccination against smallpox, have endeavored to make it appear that antivaccinators were bigoted and ignorant, and therefore not entitled to credence. The truth is that they are neither bigoted nor ignorant, but have been compelled to abandon vaccination, after giving the entire subject a careful and impartial investigation. The majority have refused to vaccinate under any consideration, and have relinquished a considerable sum of money, yearly, rather than continue a practice which they believe to be a fallacy and a crime.

They have espoused an unpopular cause, and have made many personal sacrifices to uproot what they conscientiously believe to be wrong. They have had everything to lose and nothing to gain by entering upon this crusade against vaccination, and they are confident that every candid person who will take the trouble to investigate, will enrol themselves on their side of the question. With the conviction that they are right, and with the cooperation of many of the ablest minds the world has ever known, they can afford to smile at the invectives and ridicule of the interested, indifferent, and ignorant physicians, who find it necessary to do everything in their power to perpetuate the popular faith in vaccination.

The following opinions of eminent physicians and savans, will give some idea of the extent of the disbelief in vaccination, and if they are the "ignorant men" of the nineteenth century we have no objections to being classed with them:

Dr. Joseph Herman, principal physician at the Imperial Hospital, Vienna, from 1858 to 1864, says:

"My experience of smallpox during those six years of bedside attendance, has given me the right, or rather has imposed on me the duty, of taking part in the bold and spirited onslaught on vaccination which is now being carried on in Switzerland, Germany, England, and other countries. I am convinced that vaccination is the greatest mistake and delusion in the science of medicine; a fanciful illusion in the mind of the discoverer; a phenomenal apparition, devoid of scientific foundation, and wanting in all the conditions of scientific possibility."
Dr. C.T. Pearce, London, says:

"That the increased death rate of children is coeval with the extension of vaccination; that so far from the practice being protective against smallpox, the liability to smallpox in adult life is greater in the vaccinated than in the unvaccinated."

Sir James Y. Simpson, M.D., Edinburg, says:

"Smallpox can never be exterminated by vaccination."

Dr. Simon, medical officer to the Privy Council, England, says:

"Smallpox after vaccination, has been a disappointment both to the public and the medical profession."

Dr. Caron, Paris, Chevalier of the Legion of Honor, and late Government Physician to Paris Prisons, says:

"Vaccination, so-called, modifies not one tittle of either the virulence or the consequences of the smallpox. I have long since refused to vaccinate at any price."

The Lancet (London), January 21, 1871, says:

"From the early part of the century, cases of smallpox after vaccination have been increasing and now amount to 4/5 of cases."

Dr. Vice, Ekerbery, near Stettin, says:

"I should be glad to say a few words about smallpox epidemics, because in the year 1871-72, I had 652 smallpox patients under my care, of whom 431 were French and 221 German, of various origin and ages. According to my experience—from accurate notes taken at the time—vaccination does not exercise the slightest influence in mitigating the force of the epidemic; for many of the patients had been recently vaccinated, some only 14 days, and others within six months of their being seized with the disease. The theory is pro-pounded, that after vaccination, smallpox is less severe. I contest it most vigorously, because the majority of those vaccinated were seized with the genuine smallpox
Among the French who were not vaccinated, the spurious smallpox (varicella) principally prevailed; which speaks strongly **against** vaccination.

"You must be aware of the injurious consequences so frequently resulting from the vaccination of children. Vainly do I seek to discover the advantages of vaccination." —From papers read at Medical Congress, Chemnitz, Lower Saxony, September 27, 1872.

Dr. Nittinger, of Stuttgart, writes, in 1872, of Wurtemberg:

"In five districts scarcely any medical men practiced vaccination. Out of 462 physicians in the country, only 229 vaccinated. We have to lament that since vaccination, there has been no year free from smallpox; that smallpox hospitals have been built, and are continually open that of 100; patients **before** vaccination, only 6 to 7 died; but since, from 10 to 20 die."

Dr. Charles John Bricknell, Banbury, England, says:

"I shall be ready at any time to state my belief in the inefficacy of vaccination as a preventive of smallpox, and also that the practice of vaccination is contrary to the principles of medical science. I believe it would be a great benefit to mankind if it were rendered penal to vaccinate."

Dr. Leander Joseph Keller, chief physician to the Austrian State Railways, kept a record of the mortality amongst the company's servants and their families, of 373 smallpox cases, during 1872. Dr. K. concludes his paper thus:

"1. Generally more vaccinated than unvaccinated persons are attacked by smallpox.

2. Revaccination did not protect from smallpox, and did not lessen the general mortality.

3. Neither vaccination nor revaccination exercised a favorable influence upon the smallpox mortality."

Dr. John Simon, medical officer of Privy Council, England, says:

"Vaccination is, or is not a preventive. If it be so, it is effective the first time, and
does not need to be repeated. To say that it requires repeating at stated periods of five, or seven, or ten years, is arrogant humbug and quackery."
Dr. John Simon, medical officer of Privy Council, England, says:

"The smallpox epidemic of 1870-3, was part of a worldwide prevalence of the disease. It seems universally testified by skilled observers, that no smallpox epidemic in living memory had been (if I may so express it) of equally malignant intention with that which is here in question." —Public Health Reports, 1874.

(If this be so, where is the protection of vaccination?)

Dr. Seaton, Superintendent of Vaccination, in his Public Health Reports for 1874, writing of the epidemic of smallpox for 1870-73, says:

"The peculiar intensity of this epidemic was manifested by the extreme diffusiveness of the disease; by its attacking, in unusual proportion, persons who were regarded as protected against the disease, whether by previous smallpox or by vaccination, and by the occurrence with quite remarkable frequency of cases of a malignant and haemorrhagic type, and a consequent unusually high ratio of deaths to attacks."

(Where is the virtue of vaccination, Dr. Seaton?)

Dr. H. Oidtmann, of Linnich, says:

"In Sweden, prior to the introduction of vaccination, in 1801, died of smallpox, 600 persons per 1,000,000 inhabitants, and since vaccination has been assiduously practiced there, the mortality of smallpox has gradually but regularly increased. In 1874, with a population exceeding but little the number of 4,000,000, there died of smallpox, in this State, 4,063, exhibiting thus an increase of more than 400 per 1,000,000 of inhabitants."

Dr. E. Robinson, late Medical Officer of Health, Dunkinfield, England, says:

"Whilst I have shown that the increase of 53 to 75% of smallpox after vaccination, is owing to vaccination as an operation having a tendency to increase smallpox, I wish the reader to understand that I do not look upon this tendency as constituting the most serious of the unsafe conditions inseparably connected with vaccination. The promotion of the other diseases referred to in
former pages is the influence which condemns vaccination as an unsafe remedy."—From "Can Disease Protect Health," 1880, p.32.

Dr. Stramm, Medical Staff Officer, Prussian Army, says:

"I, myself, have been vaccinated, and twice successfully revaccinated; and yet, in the exercise of my official medical duties during the late epidemics in Prussia, I have been attacked with smallpox in the most virulent confluent form, and been only saved from worse consequences by a speedy change of climate."

Dr. Ceely, Aylesbury, England, says:

"They would not be able to annihilate smallpox by vaccination, and he defied any one to show he had claimed such a result; from the experience he had had, no such thing could, or ever would happen."—Address at Calf Lymph Conference, London, December, 1879

Dr. Jules Guerin, Paris, in an address before the French Academy of Medicine, 1881, says:

"A large number of medical men consider a general vaccination and revaccination to be in itself one of the causes of smallpox; a crowd of the newly vaccinated to be itself a dangerous centre of infection; and the 150,000 revaccinations in Paris during the siege to be in some degree responsible for the great epidemics of 1870-1."

Dr. Charles Cameron, member of the House of Commons, England, says:

"Since 1836, our statistics have been compiled so as to enable us to compare the mortality, not merely in smallpox occurring in all classes of vaccinated persons, at different periods, but in each separate class of vaccinated persons—in persons, that is, with 1, 2, 3, or 4 good or indifferent marks. I have gone into these details, and found that not merely has the mortality in smallpox occurring after vaccination progressively increased in the aggregate, but it has increased in each class of cases, and increased enormously in the best vaccinated classes of cases."—Letter in London Times, May 24. 1881.

Dr. J.J. Garth Wilkinson, of London, Eng. says:
"It is demonstrable that vaccination has no influence whatever over the smallpox death rate. For the whole hospital death rate now of vaccinated and unvaccinated is just 18%; almost exactly what it was before vaccination existed."

Prof. Manniell, Royal College Surgeon, Leland:

"The term imperfect or spurious vaccination is frequently met with in books, and has been the cause of no small degree of confusion in practice, although, at the same time, it has frequently afforded the practitioner an asylum against the storms now and then arising out of failures in the protective power of the vaccine disease."

Dr. Copeland, (*Medical Dictionary* pp.832):

"Just half a century has elapsed since the discovery and introduction of vaccination, and after a quarter of a century of transcendent laudations of this measure, with merely occasional whispering of doubt; and after another quarter of a century of reverberated encomiums from well paid 'Vaccination Boards,' raised with a view of overbearing the increasing murmurings of disbelief among those who observe and think for themselves—the middle of the nineteenth century finds the majority of the profession, in all latitudes and hemispheres, doubtful as to the preponderance of advantages, present and prospective, to be obtained either from inoculation or vaccination."

Dr. Felix Von Niemeyer, says:

"It (vaccination) endangers life, and in other cases leaves permanent impairment of health."

Prof. German, M.D., University of Leipsic:

"Above all, the dire fatality which lately occurred at Lebus, a suburb of Frankfort-on-the-Oder, would alone warrant the abolition of the vaccination laws. Eighteen school girls, averaging twelve years of age, were revaccinated, and thereby syphilitised and some of them died. Yet the lymph, the syphilitic lymph, used in this case was obtained from the Official Royal Establishment for the new 'regenerated' or 'annualized' vaccine lymph so warmly recommended for the revaccination of schools."
Dr. Kolb, Munich:

"In well-vaccinated Bavaria, famous for compulsion in 1871, out of 30,742 cases, 29,439 were supplied by the vaccinated."

Prof. Francis W. Newman, of London University, says:

“Nothing is clearer to any one who will open his eyes than that what is now called vaccination has no effect in lessening smallpox, and has frequent and terrible effect in doing mischief. The doctors who urge vaccination do not believe in it, for they advise revaccination."

P.A. Taylor, M.P., England, says:

"I have no hesitation in asserting the confident opinion, as the result of much study of the question—historically and statistically—that vaccination is a ridiculous delusion—that there is no evidence that it has the slightest effect as a preventive of smallpox that indeed the negative evidence is all the other way, while the positive evidence of the mischief it has done is incontrovertible."

Adolph Count Bedtwitz, of Austria, says:

"For let medical advocates exhaust themselves as they may in sophisms, it nevertheless remains an eternal truth, that the State has no right to prescribe a medical creed to any man; and no man, with any self-respect, who has once seen through the stupid superstition, the shameless deceit of vaccination, will, without resisting to the uttermost, ever consent to the degradation of allowing the near and dear to him to be subjected to it, or lend a hand to the coercion of others."

Alexander von Humboldt, says:

"I have clearly perceived the progressive dangerous influence of vaccination in England, France and Germany."

Herbert Spencer, writes:

"I wish I had known some time since that the vaccination persecution had in any case been carried so far as you describe, as I might have made use of the fact. It would have served farther to enforce the parallel between this medical popery
which men think so defensible, and the religious popery which they think so indefensible."

Dr. Furber, of Topeka, Kansas, says:

"There is no necessity to resort to such a loathsome imaginary remedy. Vaccination is a humbug; enforced vaccination a crime."

Many more similar opinions might be quoted, but enough has been presented to give an idea of the character of the men who are opposed to vaccination.

DEDUCTIONS

From the facts presented in the foregoing pages, we cannot fail to deduce the following:

1) That Jennerian vaccination is neither practiced or believed in at the present day, therefore, he made no discovery.

2) No two physicians agree as to what constitutes efficient vaccination, therefore, the practice is empirical and unscientific.

3) That the percentage of fatal smallpox is as great now, as before Jenner's time.

4) That smallpox has largely increased during the past few years, in spite of vaccination.

5) That serious evils follow vaccination, whether the virus is humanized or bovine.

6) That vaccination has never been tested as a prophylactic against smallpox.

7) That sanitary conditions and strict isolation of patients, are the only safe guards against all zymotic diseases.

8) That the majority of the profession who advocate vaccination are primarily interested in its perpetuation.
“One of the ways that I believe people express their appreciation to the rest of humanity is to make something wonderful and put it out there.” —Steve Jobs

VACCINATION: ITS FALLACIES AND EVILS
